# 1. Purpose

This document describes the installation and upgrade process for the QuartzDesk web application 2.x on IBM WebSphere Application Server 7.0, 8.0 and 8.5.

If you experience any problems installing or upgrading the QuartzDesk web application, please let us know at <a href="mailto:support@quartzdesk.com">support@quartzdesk.com</a>.

# 2. Definitions

The following table lists all acronyms and shortcuts used throughout this document.

Acronym / Shortcut	Definition
AS	Application Server.
EAR	Enterprise Application Archive. A file with ear extension.
JAR	Java Application Archive. A file with .jar extension.
JVM	Java Virtual Machine.
WAC	WebSphere Administrative Console.
WAR	Web Application Archive. A file with .war extension.
WAS	WebSphere Application Server.

The following table lists all locations and properties used throughout this document.

Location / Property	Example	Description
DB_HOST	localhost	QuartzDesk database server host.
DB_PORT	5432	QuartzDesk database server port.
DB_NAME	quartzdesk	QuartzDesk database name.
DB_SCHEMA	quartzdesk	QuartzDesk database schema.
DB_USER	quartzdesk	QuartzDesk database user.
DB_PASSWORD	quartzdesk	QuartzDesk database user password.
WAS_INSTALL_ROOT	/usr/local/was7	WebSphere Application Server installation directory.
WAS_SERVER_NAME	server1	WebSphere Application Server name.
WAS_SERVER_PROFILE	/usr/local/was7/profiles/server1	WebSphere Application Server profile directory.
WAS_HTTP_HOST	localhost	WebSphere HTTP listener host.
WAS_HTTP_PORT	9080	Websphere HTTP listener port.
WORK_DIR	/var/quartzdesk	QuartzDesk work directory.

# 3. Requirements

### 3.1 Software Requirements

#### **3.1.1 Browser**

QuartzDesk web application GUI requires a modern JavaScript-enabled browser. Please make sure JavaScript is enabled and not blocked by third party anti-virus/anti-malware software.

The QuartzDesk web application has been tested with the following browser versions. These are also the minimum browsers versions required.

Browser	Minimum Version
Chrome	10
FireFox	3.6
Internet Explorer	8
Opera	11
Opera Safari	6

### 3.1.2 Operating System

Windows XP, Windows Vista, Windows 7, Windows 8, Windows 10. Linux (any distribution) with kernel 2.6.x and above. Solaris 11.x and above.

#### 3.1.3 **Java**

IBM Java (JDK) 6, 7, or 8 bundled with the IBM Websphere Application Server.

### 3.1.4 Application Server

IBM WebSphere Application Server 7.0.

IBM WebSphere Application Server 8.0.

IBM WebSphere Application Server 8.5.

#### 3.1.5 Database

Database	Minimum Version
DB2	10.1
H2	1.3.174
Microsoft SQL Server	2008 R2 SP1
MySQL	5.6.4
Oracle	10.2 (10g R2)
PostgreSQL	9.1

### 3.1.6 Database JDBC Driver

Database	JDBC Driver	
DB2	IBM DB2 JDBC 4.0 driver available at http://www-	
	01.ibm.com/support/docview.wss?uid=swg21363866.	

Н2	Database engine including the JDBC driver is available at <a href="http://www.h2database.com">http://www.h2database.com</a> .
Microsoft SQL Server	Microsoft JDBC driver 4.0 for SQL Server available at <a href="http://msdn.microsoft.com/en-us/sqlserver/aa937724.aspx">http://msdn.microsoft.com/en-us/sqlserver/aa937724.aspx</a> .  We strongly advise against using the alternative JTDS JDBC driver because it does not support the datetime2 data type at this time. As a result, all datetime values written by the QuartzDesk web application would end up rounded up, or down. For datetime data type rounding details, please refer to <a href="http://msdn.microsoft.com/en-us/library/ms187819.aspx">http://msdn.microsoft.com/en-us/library/ms187819.aspx</a> .
MySQL	Connector/J JDBC driver available at <a href="http://dev.mysql.com/downloads/connector/j/">http://dev.mysql.com/downloads/connector/j/</a> .
Oracle	Oracle JDBC driver available at <a href="http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html">http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html</a> .  For a comprehensive overview of JDBC driver versions vs. supported database versions, please refer to <a href="http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-faq-090281.html#01_02">http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-faq-090281.html#01_02</a> .
PostgreSQL	JDBC4 PostgreSQL driver available at <a href="http://jdbc.postgresql.org/">http://jdbc.postgresql.org/</a> .

### 3.1.7 QuartzDesk Web Application Archive

To install QuartzDesk, you need to obtain the QuartzDesk web application archive (WAR). The latest version can be downloaded at <a href="https://www.quartzdesk.com">www.quartzdesk.com</a> (click Downloads  $\rightarrow$  Latest Release  $\rightarrow$  View files  $\rightarrow$  quartzdesk-web-x.y.z.war).

### 3.2 Hardware Requirements

QuartzDesk runs on any physical or virtualized hardware that supports the above software requirements.

### 4. Installation

This chapter describes the standard QuartzDesk installation. If you are only evaluating QuartzDesk, you may be interested in the **one-step installation mode** to dramatically reduce the number of required installation steps. For details, please refer to our <u>FAQs</u> (search for "one-step installation").

Unless noted otherwise, all objects created / registered in WAC described in this document are created / registered in the application server scope.

#### 4.1 Database

Create a new database user named quartzdesk (DB\_USER) with an arbitrary password (DB\_PASSWORD).

Create a new QuartzDesk database named quartzdesk¹ ( DB\_NAME) owned by the DB\_USER.

In the QuartzDesk database create a new schema named <code>quartzdesk</code> (DB\_SCHEMA). The schema must be owned by the DB\_USER. Make the created DB\_SCHEMA the default schema of the DB\_USER and/or add the schema to the DB\_USER's schema search path.

Please refer to the database engine documentation for details on how to perform the above database operations as they are all database-specific.

Please note that you do not have to create any other database objects (tables, keys, indices etc.) in the QuartzDesk database. These objects will be automatically created by the QuartzDesk web application during the first start.

#### 4.2 JDBC Driver

Download and install the JDBC driver for the created database. For a list of supported JDBC drivers please refer to chapter 3.1.6.

In WAC (Environment  $\rightarrow$  WebSphere variables) create a new variable pointing to the directory with the JDBC driver JAR file(s) for the QuartzDesk database. Make sure the JDBC driver JAR files are readable by the user the WAS process is started under.

We suggest that you use the following variable names. Please note that some of these variables may already be defined. If the variable is already defined and points to a directory with a JDBC driver that is supported by QuartzDesk, then leave the variable as is. Otherwise, add, or adjust the variable value accordingly.

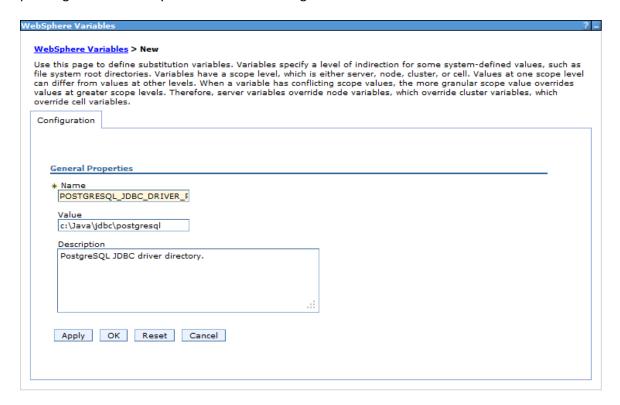

Database	WebSphere Variable Name	Default Value In WAC
DB2	DB2_JCC_DRIVER_PATH	Defined with empty value.
H2	H2_JDBC_DRIVER_PATH	Not defined.
Microsoft SQL Server	MICROSOFT_JDBC_DRIVER_PATH	Defined with empty value.
MySQL	MYSQL_JDBC_DRIVER_PATH	Not defined.

<sup>&</sup>lt;sup>1</sup> DB2 restricts the database name length to the maximum of 8 characters. Please adjust the database name accordingly (e.g. qdesk).

Oracle	ORACLE_JDBC_DRIVER_PATH	Defined with empty value.
PostgreSQL	POSTGRESQL_JDBC_DRIVER_PATH	Not defined.

The following is an example of creating a new variable named POSTGRESQL\_JDBC\_DRIVER\_PATH pointing to the directory that contains the PostgreSQL JDBC driver JAR file.

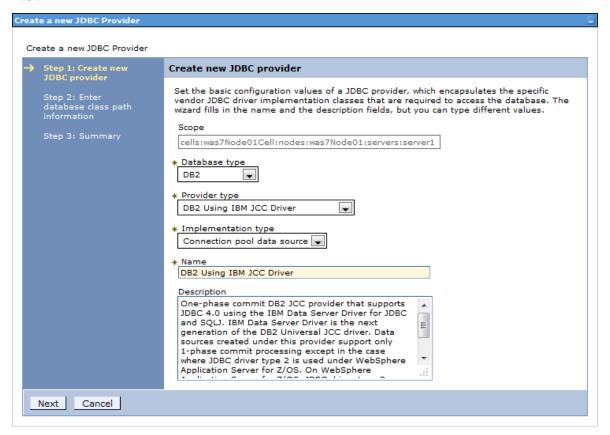

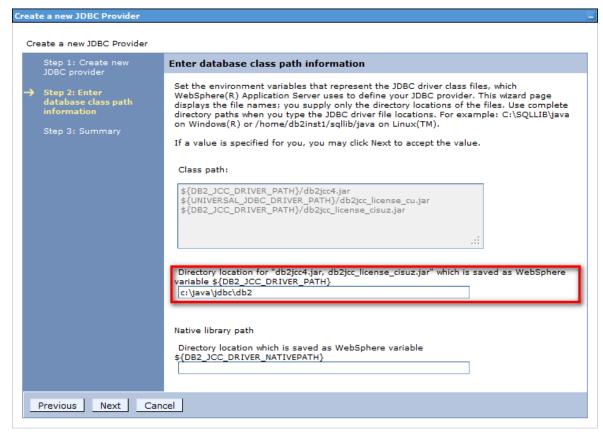

#### 4.3 JDBC Provider

In WAC (Resources  $\rightarrow$  JDBC  $\rightarrow$  JDBC providers) register a JDBC provider for the QuartzDesk database data-source.

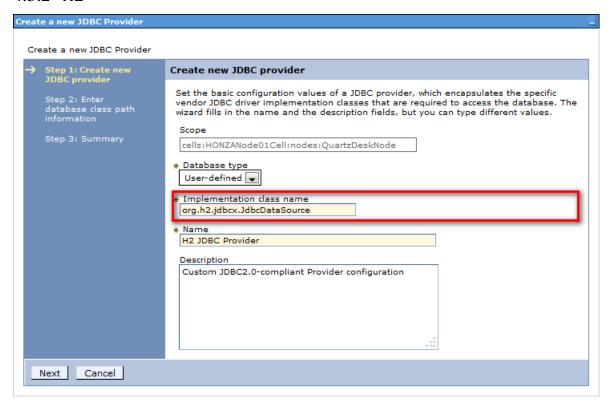

#### 4.3.1 **DB2**

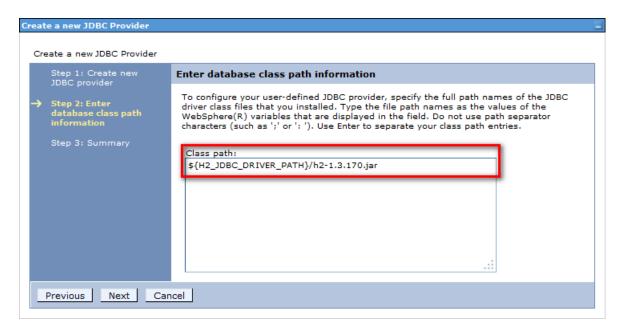

#### 4.3.2 **H2**

Database type: User-defined

Implementation class name: org.h2.jdbcx.JdbcDataSource

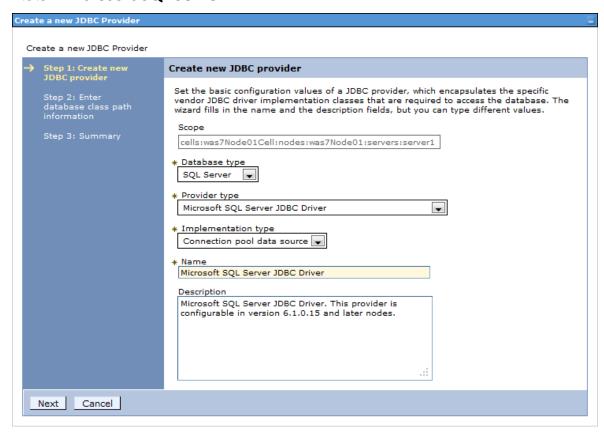

Name: H2 JDBC Provider

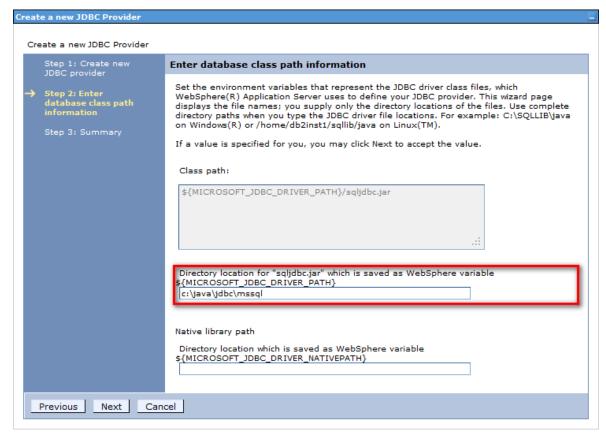

Class path: H2 JDBC driver classpath

### 4.3.3 Microsoft SQL Server

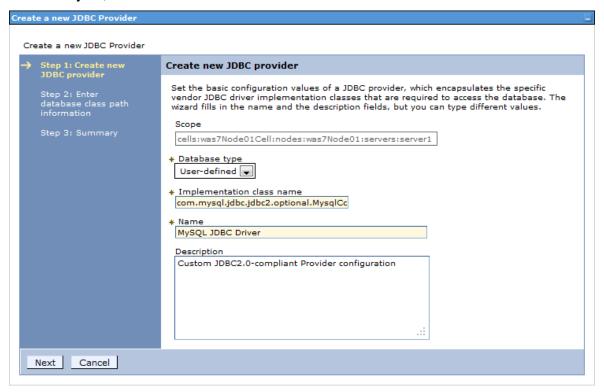

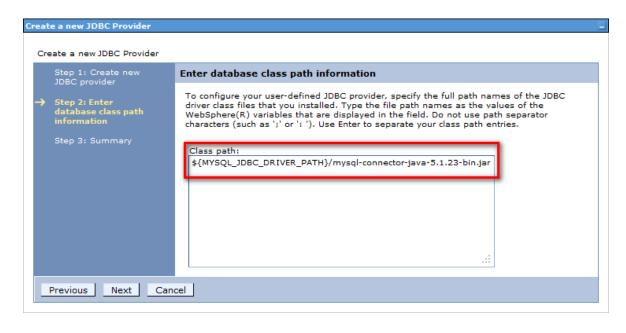

The name of the Microsoft SQL Server driver JAR file is sqljdbc4.jar and not sqljdbc.jar as suggested by WAC (see the default "Class path" value in the figure above). To fix the name of the JAR file you will need to edit the JDBC provider class path after it has been saved.

#### 4.3.4 **MySQL**

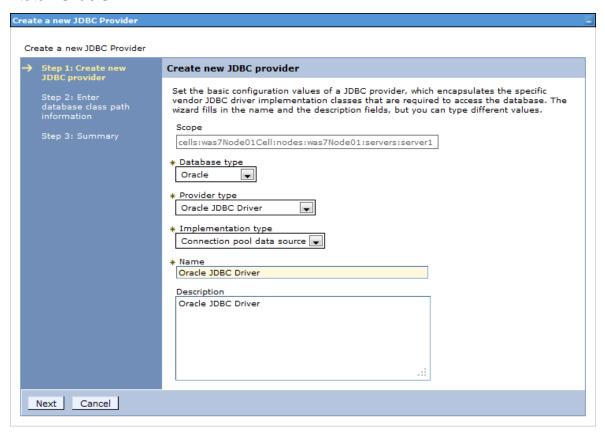

#### Implementation class name:

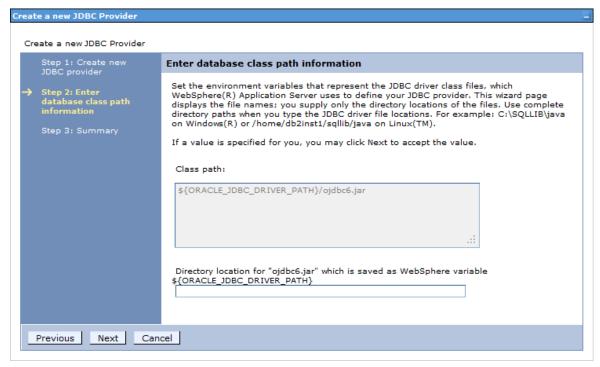

com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource

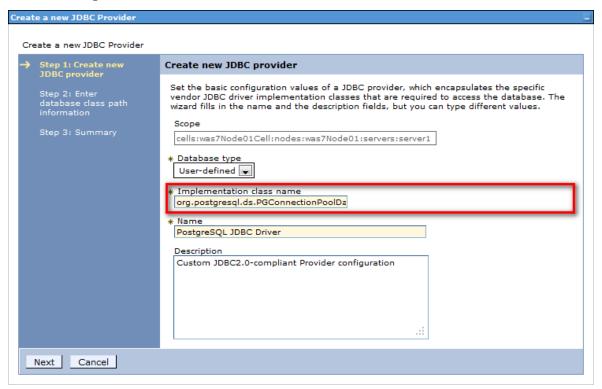

#### 4.3.5 **Oracle**

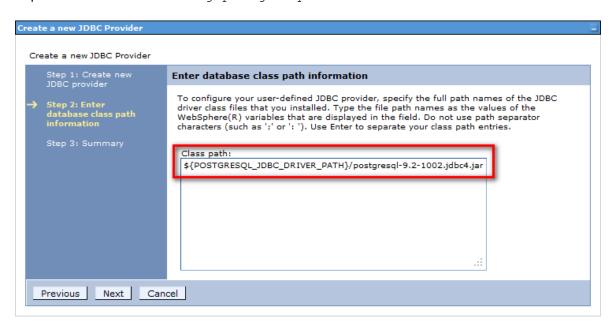

### 4.3.6 PostgreSQL

Implementation class name: org.postgresql.ds.PGConnectionPoolDataSource

#### 4.4 Data Source J2C Authentication Data

In WAC (Security  $\rightarrow$  Global Security  $\rightarrow$  Java Authentication and Authorization Service  $\rightarrow$  J2C Authentication Data) create a new authentication entry for the QuartzDesk database data source.

Alias: AuthQuartzDeskDS

User ID: DB\_USER

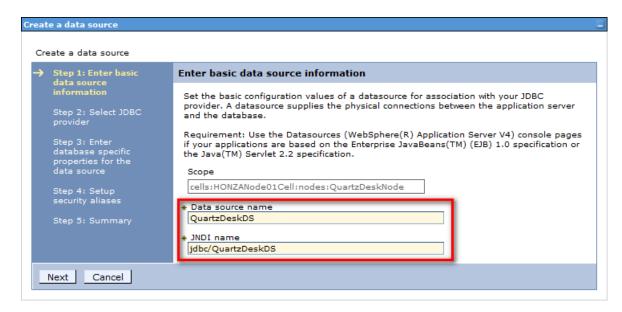

Password: DB\_PASSWORD

#### 4.5 Data Source

In WAC (Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources) create a new data source for the QuartzDesk database.

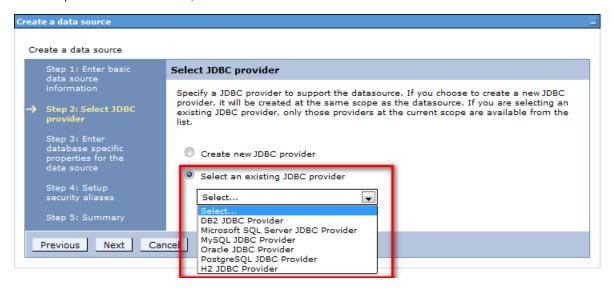

In Step 1, provide the data source name and JNDI name.

Data source name: QuartzDeskDS JNDI name: jdbc/QuartzDeskDS

In Step 2, select the JDBC provider created in 4.3.

The following steps depend on the selected JDBC provider.

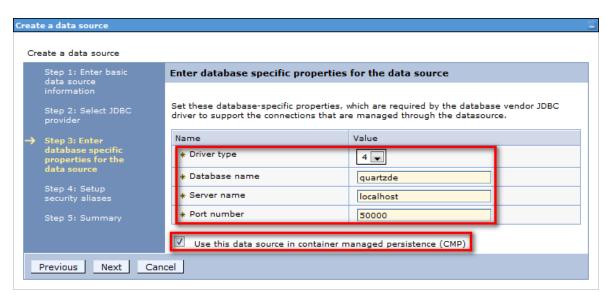

#### 4.5.1 **DB2**

In Step 3, provide these values:

Driver type: 4

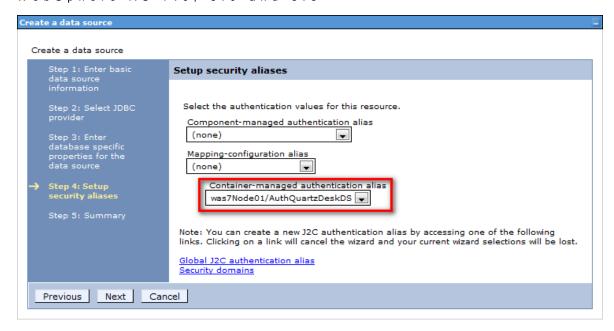

Database name: DB\_NAME Server name: DB\_HOST Port number: DB\_PORT

Leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the created data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100

Retry Interval: 3

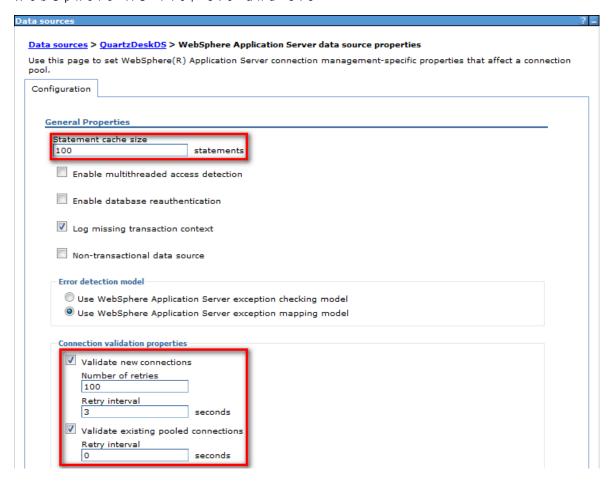

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1 from sysibm.sysdummy1

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

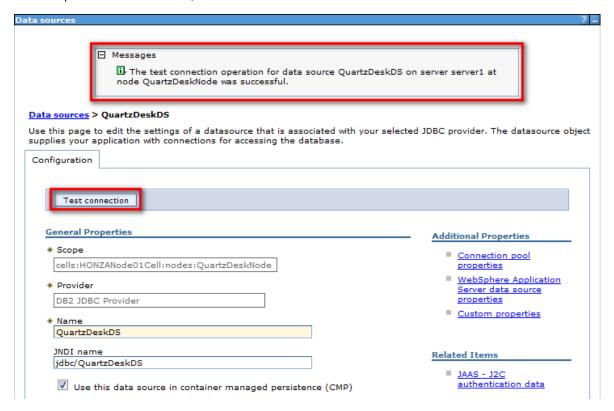

Name: clientApplicationInformation

Value: QuartzDesk

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

Check there are no errors displayed.

#### 4.5.2 **H2**

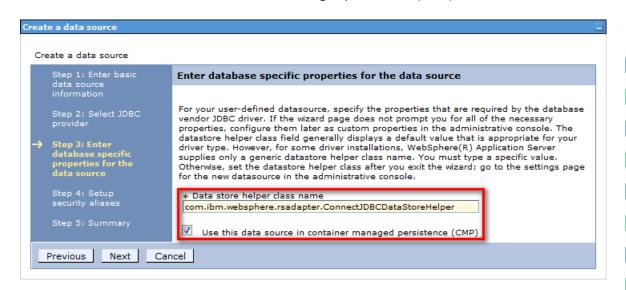

We recommend using H2 for evaluation and/or experimental purposes only. We strongly discourage using H2 in production environments.

In Step 3, change the default data store helper class.

#### Data store helper class name:

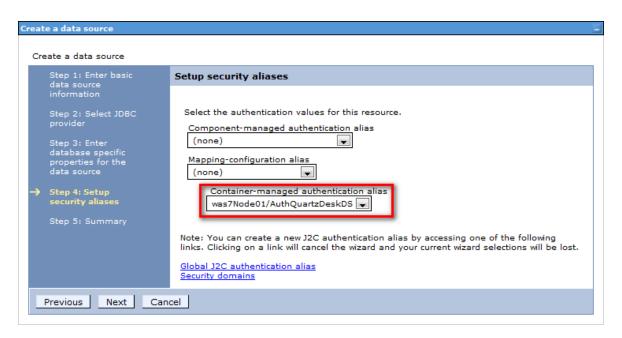

com.ibm.websphere.rsadapter.ConnectJDBCDataStoreHelper

Leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100

Retry Interval: 3

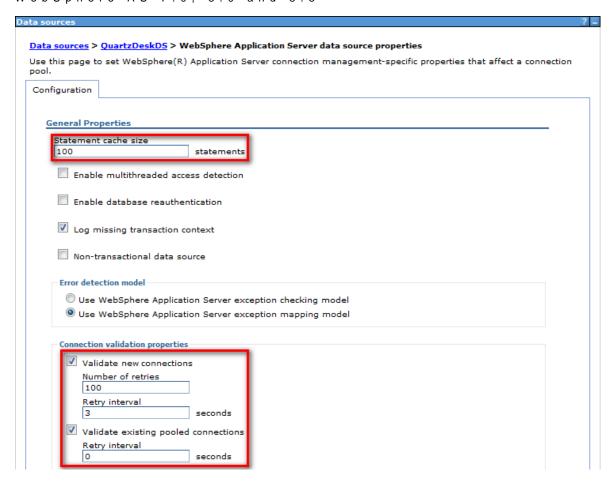

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

Name: URL

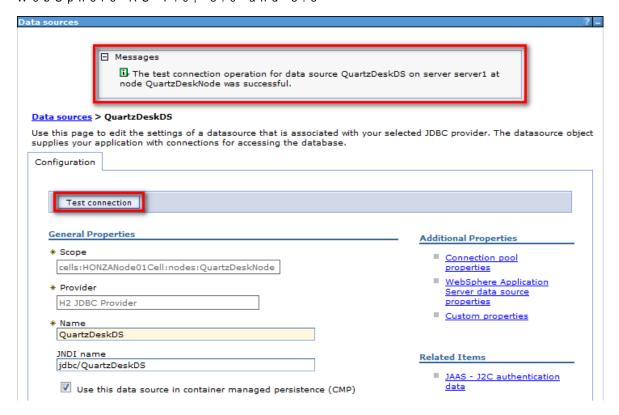

Value: jdbc:h2:file:<H2 DB FILE PATH>

Please note that H2 can be configured to run in various operating modes by adjusting the database URL value. For details, please refer to the H2 documentation at <a href="http://www.h2database.com/html/features.html#database\_url">http://www.h2database.com/html/features.html#database\_url</a>.

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

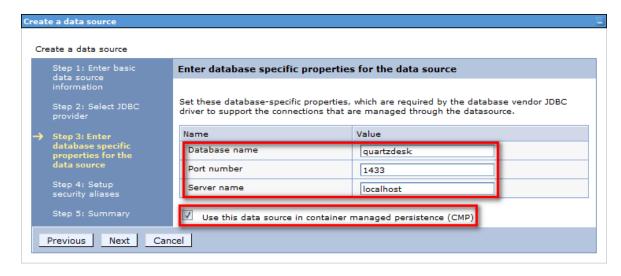

Check there are no errors displayed.

### 4.5.3 Microsoft SQL Server

In Step 3, provide these values:

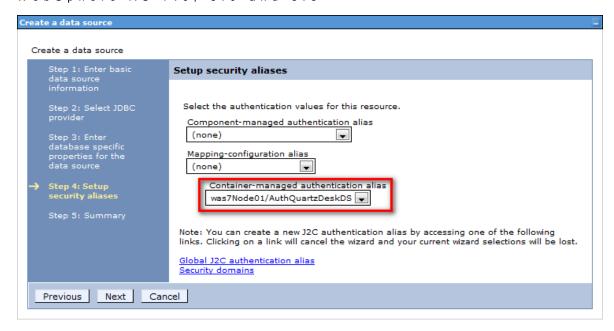

Database name: DB\_NAME Server name: DB\_HOST Port number: DB\_PORT

Leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the created data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100 Retry Interval: 3

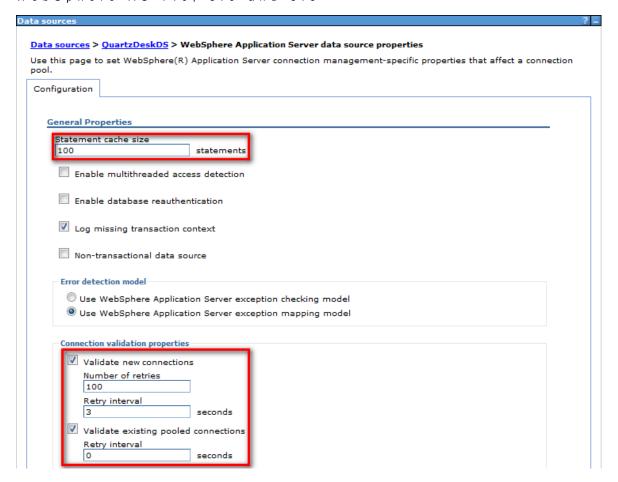

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

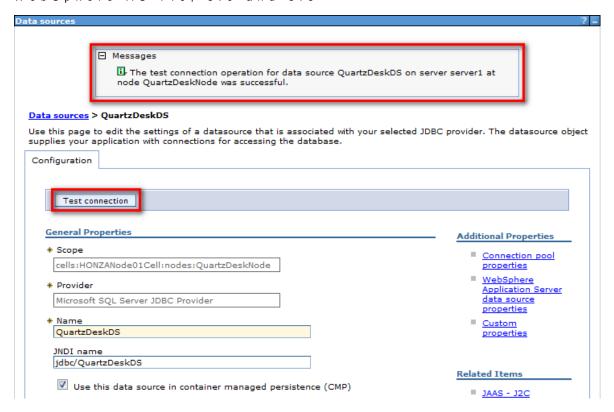

Name: applicationName Value: QuartzDesk

Depending on your Microsoft SQL Server configuration, you may need to set the value of the instanceName property. Read the property description for details.

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

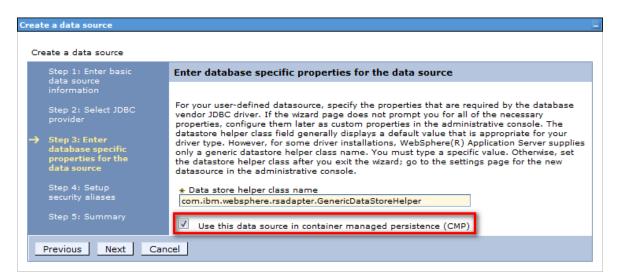

Check there are no errors displayed.

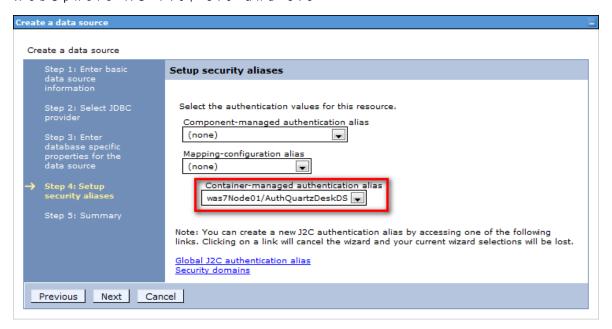

### 4.5.4 **MySQL**

In Step 3, leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100

Retry Interval: 3

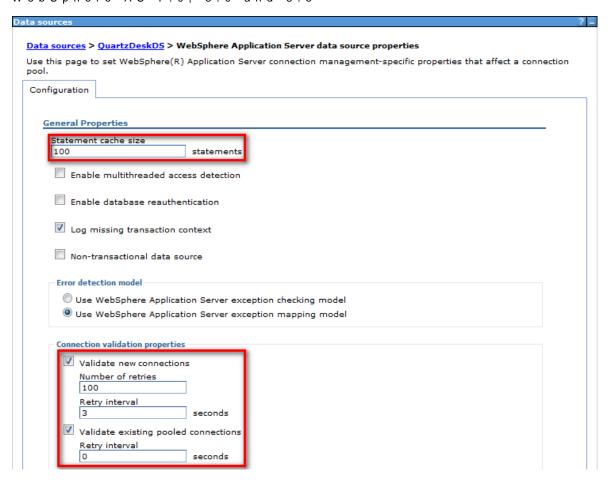

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

Name: databaseName Value: DB\_NAME

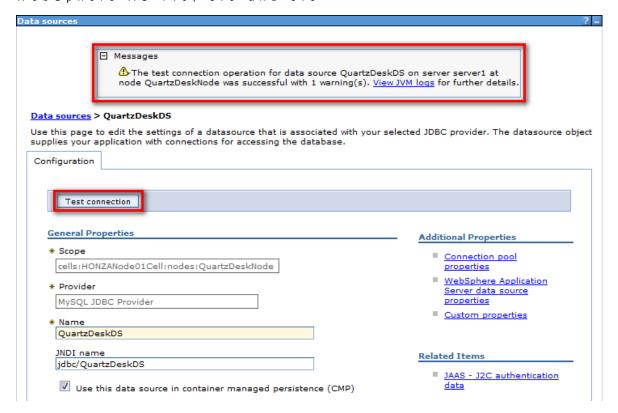

Name: serverName Value: DB\_HOST

Name: portNumber Value: DB\_PORT

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

Check there are no errors displayed.

When testing the connection of a data source using a JDBC provider with the "Database type" option set to "User type", there may be a warning message displayed. In the JVM logs, the following message is logged:

DSRA0174W: Warning: GenericDataStoreHelper is being used.

You can ignore this warning safely.

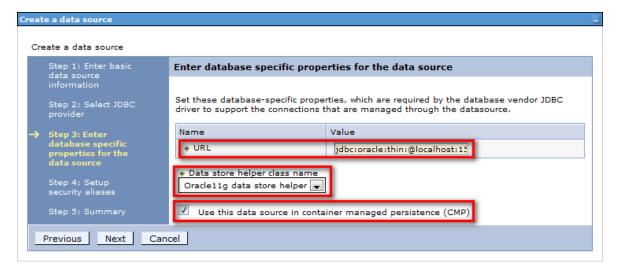

#### 4.5.5 **Oracle**

In Step 3, provide the URL value:

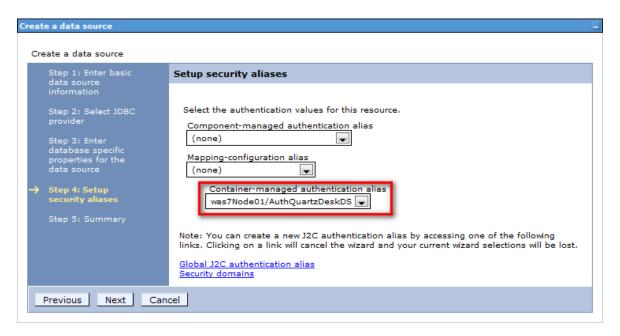

URL: jdbc:oracle:thin:@DB\_HOST:DB\_PORT

Select the "Data store helper class name" based on your Oracle database version.

Leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the created data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100

Retry Interval: 3

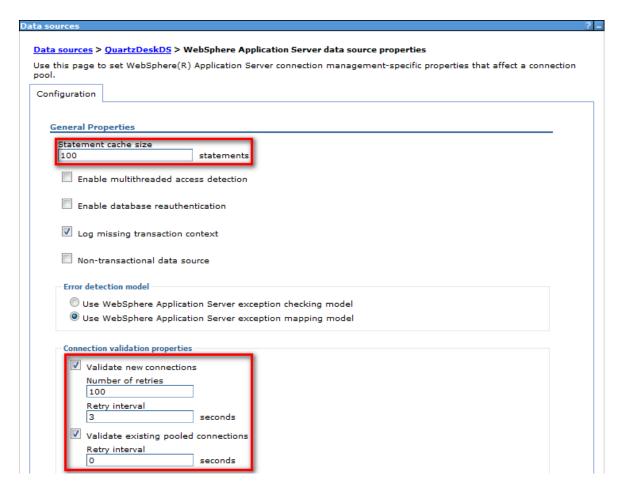

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1 from dual

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

Name: driverType

Value: thin

Name: databaseName Value: DB\_NAME

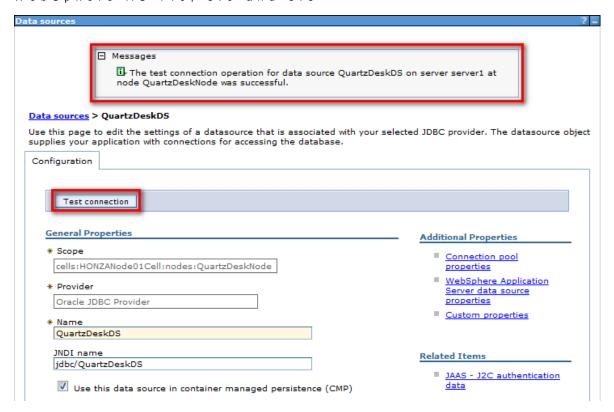

Name: serverName Value: DB\_HOST

Name: portNumber Value: DB\_PORT

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

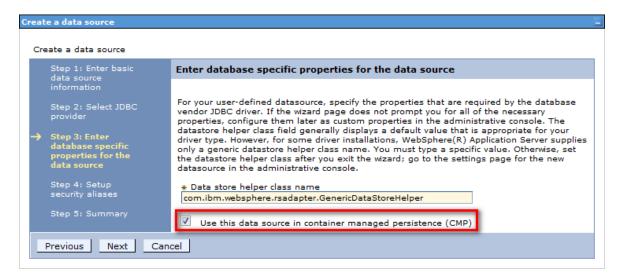

Check there are no errors displayed.

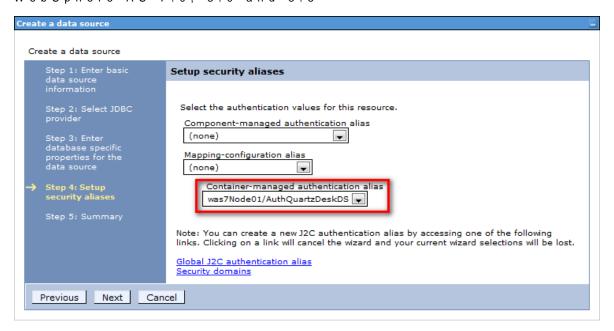

### 4.5.6 PostgreSQL

In Step 3, leave the "Use this data source in container managed persistence (CMP)" checkbox checked.

In Step 4, select the J2C authentication alias created in 4.4 as the Container-managed authentication alias.

Click Next and then Finish. Save changes.

Edit the data source properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  WebSphere Application Server data source properties.

Set the following properties: Statement cache size: 100

Validate new connectons: checked

Number of retries: 100

Retry Interval: 3

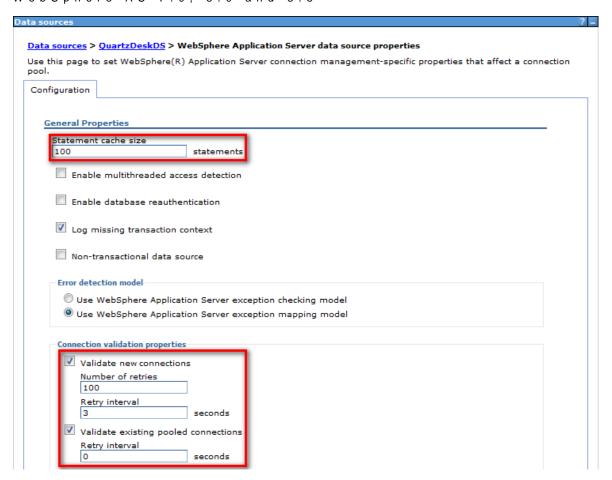

Validate existing pooled connections: checked

Retry interval: 0

Select "Validation by SQL query" with the following query:

select 1

Apply and Save changes.

Edit the data source custom properties by going to Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS  $\rightarrow$  Custom properties.

Set the following properties:

Name: applicationName

Value: QuartzDesk

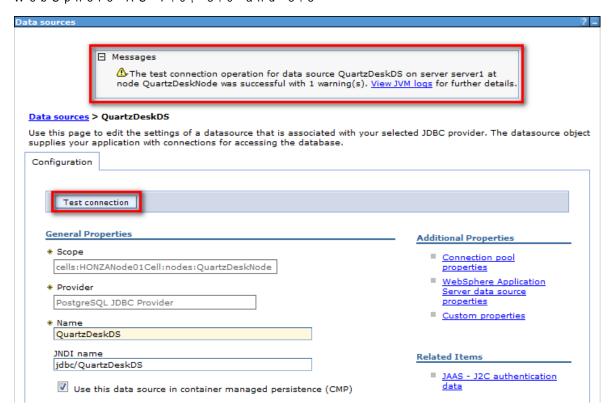

Name: databaseName Value: DB\_NAME

Name: serverName Value: DB HOST

Name: portNumber Value: DB\_PORT

Apply and Save changes.

Test the created data source by clicking the "Test connection" button under Resources  $\rightarrow$  JDBC  $\rightarrow$  Data sources  $\rightarrow$  QuartzDeskDS.

Check there are no errors displayed.

When testing connection of a data source using a JDBC provider with the "Database type" option set to "User type", there may be a warning message displayed. In the JVM logs, the following message is logged:

DSRA0174W: Warning: GenericDataStoreHelper is being used.

You can ignore this warning safely.

### 4.6 Application Work Directory

Create QuartzDesk work directory (WORK\_DIR) anywhere on the local file system. The directory must be readable and writeable by the user the WAS process runs under.

Copy your QuartzDesk license key file (license.key) to WORK\_DIR.

You can obtain a free 30-day trial license key at <a href="www.quartzdesk.com">www.quartzdesk.com</a> (open the Try / Purchase menu).

Open the QuartzDesk web application archive (quartzdesk-web-x.y.z.war) and copy all files from the extras/work directory into WORK\_DIR.

If you cannot open the WAR file directly, rename it to \*.zip. Do not forget to rename the file back to \*.war once you have extracted the required files.

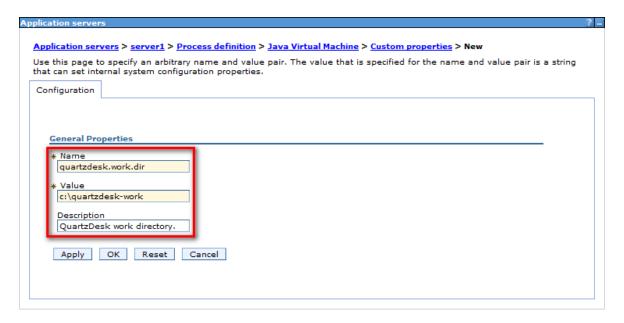

In the following figure you can see an example of a QuartzDesk work directory correctly set up on a Microsoft Windows machine.

In WAC open Servers  $\rightarrow$  Server Types  $\rightarrow$  WebSphere application servers  $\rightarrow$  WAS\_SERVER\_NAME  $\rightarrow$  Java and Process Management  $\rightarrow$  Process Definition  $\rightarrow$  Java Virtual Machine  $\rightarrow$  Custom Properties. Add a new JVM system property:

Name: quartzdesk.work.dir

Value: WORK\_DIR

Apply and Save changes.

### 4.7 Application Configuration

 $\label{lem:configuration} \textbf{Open the QuartzDesk configuration file} \ \texttt{WORK\_DIR}/\texttt{quartzdesk.properties}.$ 

Based on the type and version of the database created in step 4.1, change the value of the db.profile configuration property according to the following table.

Database	Database Version	db.profile Value
DB2	>= 10.0	db2
H2	>= 1.3.170	h2

Microsoft SQL Server	>= 2008	mssql
MySQL (MyISAM)	>= 5.6	mysql
MySQL (InnoDB)	>= 5.6	mysql_innodb
Oracle	== 8i	oracle8
Oracle	>= 9i	oracle9
PostgreSQL	== 8.1	postgres81
PostgreSQL	>= 8.2	postgres82

Optionally, you can adjust the QuartzDesk logging parameters by editing the WORK\_DIR/logback.xml configuration file. The default sample logback.xml configuration file makes QuartzDesk log under the WORK\_DIR/logs directory that is automatically created when QuartzDesk starts. Please refer to the Logback Manual for Logback configuration details.

### 4.8 Deploy Application

Before deploying QuartzDesk Web Application, please remove the WEB-INF/lib/jboss-transaction-api\_<version>.jar library from the quartzdesk-web-x.y.z.war file. This is required to avoid class loading conflicts between the bundled JTA API and the JTA API provided by WAS runtime.

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications.

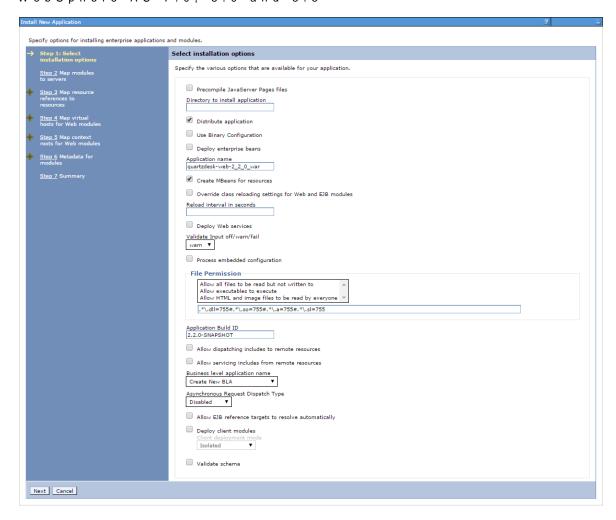

Click the Install button and select the quartzdesk-web-x.y.z.war file. Click Next.

Leave the "Fast Path" radio button selected. Click Next.

#### Step 1 – Select installation options

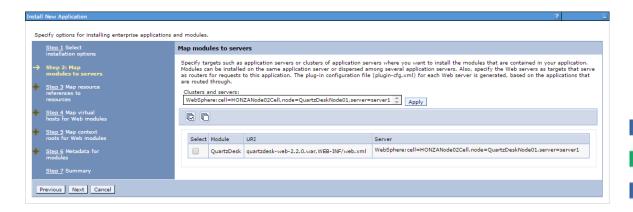

Click Next.

#### Step 2 – Map modules to servers

Map the QuartzDesk web module to the desired application server(s).

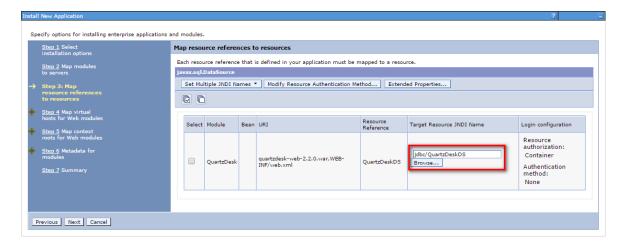

Click Next.

#### Step 3 – Map resource references to resources

Map the QuartzDeskDS data source reference to the JNDI name of the QuartzDesk data source created in 4.5.

Click Next.

#### Step 4 - Map virtual hosts for Web modules

Map the QuartzDesk web module to the desired WebSphere virtual host.

Click Next.

#### Step 5 - Map context roots for Web modules

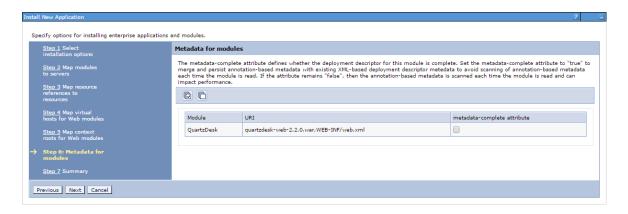

Provide the web servlet context root for the QuartzDesk web application. We recommend using "/quartzdesk" (without quotes).

Click Next.

#### Step 6 – Metadata for modules (only WAS >= 8.0)

#### Click Next.

#### Step 7 – Summary

#### Click Finish.

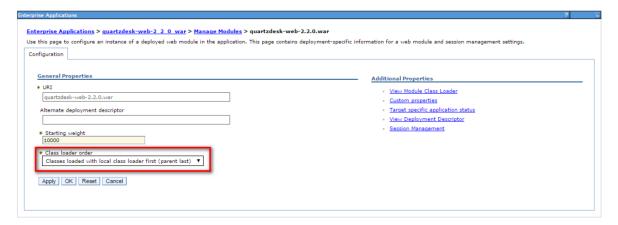

When the installation completes, Save changes.

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications  $\rightarrow$  quartzdesk-web-x\_y\_z\_war.

Click on Manage Modules → QuartzDesk.

In "Class loader order" select the "Classes loaded with local class loader first (parent last)" option.

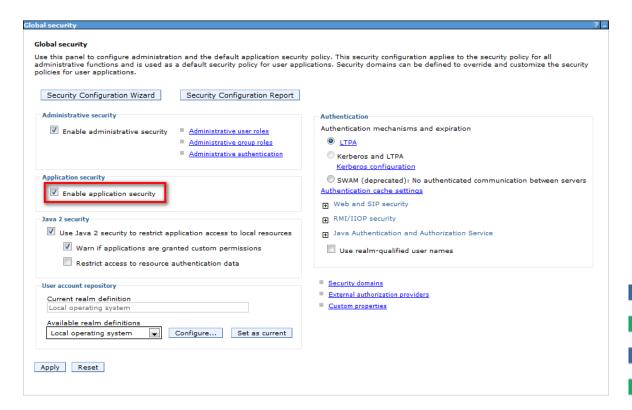

### 4.9 Security

QuartzDesk supports the HTTP/S Basic authentication scheme to authenticate users who access the application. To configure application security, perform the following two steps:

### 4.9.1 Enable application security

In WAC go to Security → Global security. Make sure the Enable application security checkbox is checked.

## 4.9.2 Map security roles to users / groups

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications  $\rightarrow$  quartzdesk-web-x\_y\_x\_war  $\rightarrow$  Security role to user/group mapping and map the following 3 QuartzDesk security roles to the desired users / groups defined in WAS security realms.

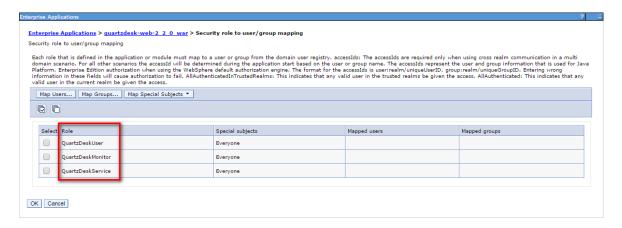

Security Role Description

QuartzDeskUser	Role required to access the QuartzDesk web application UI (QuartzDesk GUI).
QuartzDeskMonitor	Role required to access the scheduler, job and trigger monitoring URLs (REST API).
QuartzDeskService	Role required to access QuartzDesk web-services (e.g. the QuartzAnywhere web-service).

By mapping the QuartzDesk security role to the special subject Everyone, you effectively disable user authentication for that role. In the following figure user authentication has been disabled for the entire application.

Click OK. Save changes.

### 4.10 Start Application

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications. Select the checkbox next to the QuartzDesk web application in the Enterprise Applications list. Click the Start button and wait for the startup procedure to complete.

Check WAS logs under WAS SERVER PROFILE/logs for errors.

Check the QuartzDesk web application logs (by default in the  $WORK\_DIR/logs$  directory) for errors.

If there are no errors, point your browser to <a href="http://WAS\_HTTP\_HOST:WAS\_HTTP\_PORT/quartzdesk">http://WAS\_HTTP\_HOST:WAS\_HTTP\_PORT/quartzdesk</a> and verify that the QuartzDesk web application works.

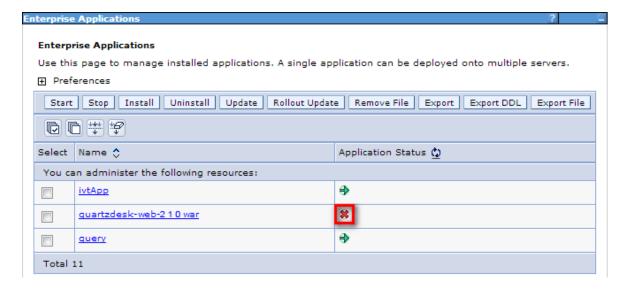

# 5. Upgrading

### 5.1 Stop Existing Application

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications. Select the checkbox next to the QuartzDesk web application in the Enterprise Applications list. Click the Stop button at the top of the list. Wait for the action to complete.

Upon successful stopping, the Application Status flag, shown next the existing QuartzDesk web application in the Deployments list, indicates that the applications has been stopped.

#### 5.2 Backup

Backup your QuartzDesk database. We recommend performing a full database backup.

Backup the contents of the QuartzDesk work directory.

Backup the QuartzDesk web application in WAC by going to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications. Select the QuartzDesk web application by selecting the checkbox on the line. Click the Export button and wait for the export to complete. Download the exported WAR file.

Store the backup files in a safe place so that you can restore the original QuartzDesk web application version if the need arises.

### 5.3 Remove Existing Application

In WAC go to Applications  $\rightarrow$  Application Types  $\rightarrow$  WebSphere enterprise applications. Select the checkbox next to the QuartzDesk web application in the Enterprise Applications list. Click the Uninstall button at the top of the list. Wait for the action to complete and Save the changes when prompted.

Upon successful removal, the QuartzDesk web application disappears from the Enterprise Applications list.

### 5.4 Deploy New Application

Deploy the new version of the QuartzDesk web application by following the deployment steps outlined in 4.8. Continue with the security role mapping configuration in 4.9.2.

### 5.5 Start New Application

Start the new QuartzDesk web application by following the steps outlined in 4.10.

Check the version number of the deployed QuartzDesk web application to make sure the application has been successfully upgraded. For details on how to find out the version number of a deployed QuartzDesk web application, please refer to our FAQs at <a href="www.quartzdesk.com">www.quartzdesk.com</a> (click Support → FAQs and search for "find out version").

# 6. Cluster Deployment Notes

When deploying the QuartzDesk web application to a WebSphere cluster you need to follow the configuration steps described in preceding chapters. In addition to these, there are several extra configuration steps that must be performed for a cluster deployment.

### 6.1 HTTP Session Replication and Affinity

QuartzDesk web application makes use of HTTP sessions and to store some short-lived and user-specific data. To achieve high-availability (HA), it is necessary to make the session data available on all application cluster members so that when one cluster member becomes unavailable, the remaining cluster members can take over and handle user requests without the user noticing any service interruption. To make the session data available on all application cluster members, the HTTP session replication process must be enabled on the cluster.

The amount of data stored by QuartzDesk web application in an HTTP session is kept at the absolute minimum to reduce the session replication overhead. The total size of data stored in the session does not exceed 1KB.

When configuring session replication, we recommend that you also enable session affinity (sticky-sessions) on the load-balancer so that all user requests are preferably passed to the WebSphere instance that handled the first user request that established the session.

Please refer to the WebSphere and load-balancer documentation for details on how to configure session replication and session affinity because the actual steps may vary depending on the WebSphere cluster topology and configuration.

#### 6.2 Shared Work Directory

We recommend that you put the QuartzDesk work directory, described in chapter 4.6, on a shared drive and make this work directory available to all cluster members. Not only does this make application and configuration upgrading easier, it is actually requited by all "Save" (for example, Save Log, Save Chart etc.) actions provided by the QuartzDesk web application GUI. These actions trigger two subsequent HTTP requests where the first request prepares the data and stores it in the  $\mathtt{WORK\_DIR}/\mathtt{tmp}$  directory and the second request downloads the data and makes the browser open the Save As dialog.

During a fail-over or if the session affinity is not enabled, it can easily happen that the first request is handled by cluster member A and the second request is handled by cluster member B. If A and B are not configured to use the same  $\mathtt{WORK\_DIR}/\mathtt{tmp}$  directory, then B will fail to serve the data prepared by A during the preceding request because the data will not be found.

### 6.3 Logging Configuration

If you set up your cluster to use a shared QuartzDesk web application work directory, as described in the previous chapter, you will need to edit the QuartzDesk web application logging configuration file  $\mathtt{WORK\_DIR/logback.xml}$  and decide where QuartzDesk web application instances running on individual cluster members should log. There are two options:

- 1) Logging into the same (shared) log files.
- 2) Logging into separate log files.

QuartzDesk web application uses two log files – quartzdesk.log and quartzdesk-trace.log that are stored in WORK DIR/logs directory. The following chapters discuss these two options.

### 6.3.1 Using Shared Log Files

In order to make individual QuartzDesk web application instances log into the same log files, you must enable the prudent mode on both file appenders used in the  $WORK\_DIR/logback.xml$  configuration file:

```
<appender name="FILE"</pre>
class="ch.qos.logback.core.rolling.RollingFileAppender">
 <file>${logs.dir}/quartzdesk.log</file>
  <append>true</append>
  cprudent>true
</appender>
<appender name="TRACE FILE"</pre>
class="ch.qos.logback.core.rolling.RollingFileAppender">
  <file>${logs.dir}/quartzdesk-trace.log</file>
  <append>true</append>
  cprudent>true
  . . .
   We must use the TimeBasedRollingPolicy because the
   FixedWindowRollingPolicy is not supported in prudent mode!
  <rollingPolicy class="ch.qos.logback.core.rolling.TimeBasedRollingPolicy">
    <!-- daily rollover -->
    <fileNamePattern>${logs.dir}/quartzdesk.log.%d{yyyy-MM-
dd}</fileNamePattern>
    <!-- keep 10 days' worth of history -->
    <maxHistory>10</maxHistory>
  </rollingPolicy>
   The SizeBasedTriggeringPolicy removed because it is used only in
   conjunction with the FixedWindowRollingPolicy.
  <encoder>
   <charset>UTF-8</charset>
    <pattern>[%date] %.-1level [%thread] [%mdc] [%logger:%line] --
%msg%n</pattern>
  </encoder>
</appender>
. . .
```

For details on the Logback prudent mode, please refer to <a href="http://logback.gos.ch/manual/appenders.html#FileAppender">http://logback.gos.ch/manual/appenders.html#FileAppender</a>.

Because prudent mode relies on exclusive file locks to manage concurrent access to the log files and these locks can have negative impact on the QuartzDesk web application's performance, we generally discourage using the prudent mode and shared log files.

### 6.3.2 Using Separate Log Files

In order to make individual QuartzDesk web application instances log into separate log files, you can use a JVM system property set on all cluster member JVMs. The value of this property must be unique for all cluster members. The property can be referred to from the WORK DIR/logback.xml logging configuration file.

The following examples assume the use of the cluster.member.instanceId JVM system property, but any JVM system property name can be used.

There are two common approaches as to where the separate log files produced by individual QuartzDesk web application instances are stored:

1) Log files created under a common log root directory.

```
<appender name="FILE"</pre>
class="ch.qos.logback.core.rolling.RollingFileAppender">
  <file>${logs.dir}/quartzdesk-${cluster.member.instanceId}.log</file>
  <append>true</append>
  <rollingPolicy class="ch.qos.logback.core.rolling.TimeBasedRollingPolicy">
   <!-- daily rollover -->
    <fileNamePattern>${logs.dir}/quartzdesk-
${cluster.member.instanceId}.log.%d{yyyy-MM-dd}</fileNamePattern>
   <!-- keep 10 days' worth of history -->
    <maxHistory>10</maxHistory>
  </rollingPolicy>
</appender>
<appender name="TRACE FILE"</pre>
class="ch.qos.logback.core.rolling.RollingFileAppender">
  <file>${logs.dir}/quartzdesk-${cluster.member.instanceId}-trace.log</file>
  <append>true</append>
  <rollingPolicy
class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
   <fileNamePattern>${logs.dir}/quartzdesk-${cluster.member.instanceId}-
trace.log.%i</fileNamePattern>
    <minIndex>1</minIndex>
    <maxIndex>5</maxIndex>
  </rollingPolicy>
  . . .
</appender>
```

2) Log files created in separate (cluster member specific) log root directories.

#### 6.4 Internal Quartz Scheduler

QuartzDesk web application ships with an embedded Quartz scheduler to periodically execute its internal jobs. When deploying the QuartzDesk web application to a cluster, it is necessary to assign unique instance IDs to Quartz scheduler instances running in the clustered QuartzDesk web application instances.

For these purposes the QuartzDesk web application configuration (quartzdesk.properties file) provides the scheduler.org.quartz.scheduler.instanceIdGenerator.class configuration property. The value of this property must be a fully-qualified class name of a Java class that implements the org.quartz.spi.InstanceIdGenerator Quartz API interface. Quartz API provides two out of the box implementations suitable for clustered QuartzDesk web application deployments:

Implementation	Description
org.quartz.simpl.Hostna meInstanceIdGenerator	This implementation is suitable for QuartzDesk web application deployments where individual clustered QuartzDesk web application instances run on distinct hosts and each of these hosts is assigned a unique hostname.
	This is the default implementation used by QuartzDesk. No QuartzDesk configuration changes are necessary to use this instance ID generator.
org.quartz.simpl.System PropertyInstanceIdGener ator	This implementation is suitable for QuartzDesk web application deployments where some of the clustered QuartzDesk web application instances run on the same host.
	This implementation extracts the Quartz scheduler instance ID from the org.quartz.scheduler.instanceId JVM system property that must be explicitly set.
	Please refer to the WebSphere documentation for details on how to add a new JVM system property.

Please refer to the table above and optionally modify the value of the scheduler.org.quartz.scheduler.instanceIdGenerator.class configuration property according to the cluster configuration.
