| <b>8.</b> | <b>CLUSTER DEPLOYMENT NOTES.....</b>               | <b>55</b> |
| 8.1       | HTTP SESSION REPLICATION AND AFFINITY .....        | 55        |
| 8.2       | SHARED WORK DIRECTORY.....                         | 55        |
| 8.3       | LOGGING CONFIGURATION .....                        | 55        |
| 8.3.1     | <i>Using Shared Log Files.....</i>                 | 56        |
| 8.3.2     | <i>Using Separate Log Files.....</i>               | 57        |
| 8.4       | INTERNAL QUARTZ SCHEDULER .....                    | 58        |

## 1. Purpose

This document describes the installation and upgrade process for QuartzDesk Web Application 4.x on WildFly Application Server 10.x–18.x running in the **standalone** mode.

The installation and upgrade process in the **domain** mode is similar and is not described herein.

If you experience any problems installing or upgrading QuartzDesk Web Application, please let us know at [support@quartzdesk.com](mailto:support@quartzdesk.com).

## 2. Definitions

The following table lists all acronyms and shortcuts used throughout this document.

| Acronym / Shortcut | Definition  |
|--------------------|---|
| <b>AS</b>          | Application Server.   |
| <b>EAR</b>         | Enterprise Application Archive. A file with .ear extension. |
| <b>JAR</b>         | Java Application Archive. A file with .jar extension.       |
| <b>JVM</b>         | Java Virtual Machine.                                       |
| <b>WFAC</b>        | WildFly Administrative Console.                             |
| <b>WFAS</b>        | WildFly Application Server.                                 |
| <b>WAR</b>         | Web Application Archive. A file with .war extension.        |

The following table lists all locations and properties used throughout this document.

| Location / Property      | Example                  | Description  |
|--------------------------|--------------------------|--|
| <b>DB_HOST</b>           | localhost                | QuartzDesk Web Application database server host.   |
| <b>DB_PORT</b>           | 5432                     | QuartzDesk Web Application database server port.   |
| <b>DB_NAME</b>           | quartzdesk               | QuartzDesk Web Application database name.          |
| <b>DB_SCHEMA</b>         | quartzdesk               | QuartzDesk Web Application database schema.        |
| <b>DB_USER</b>           | quartzdesk               | QuartzDesk Web Application database user.          |
| <b>DB_PASSWORD</b>       | quartzdesk               | QuartzDesk Web Application database user password. |
| <b>WFAS_INSTALL_ROOT</b> | /usr/local/wildfly       | WildFly Application Server installation directory. |
| <b>WFAS_CONFIG</b>       | standalone               | WildFly Application Server configuration.          |
| <b>WFAS_HTTP_HOST</b>    | localhost                | WildFly HTTP listener host.                        |
| <b>WFAS_HTTP_PORT</b>    | 8080                     | WildFly HTTP listener port.                        |
| <b>WORK_DIR</b>          | /var/quartzdesk-web.work | QuartzDesk Web Application work directory.         |

## 3. Requirements

### 3.1 Software Requirements

#### 3.1.1 Browser

The QuartzDesk Web Application's GUI requires a modern JavaScript-enabled browser. Please make sure JavaScript is enabled and not blocked by third party anti-virus/anti-malware software.

QuartzDesk Web Application has been tested with the following browser versions. These are also the minimum browsers versions required.

| Browser           | Minimum Version |
|-------------------|-----------------|
| Chrome            | 64              |
| Firefox           | 45              |
| Internet Explorer | 8               |
| Microsoft Edge    | 12              |
| Opera             | 43              |
| Safari            | 10              |

#### 3.1.2 Operating System

Windows 7, Windows 8, Windows 10.

Linux (any distribution) with kernel 2.6.x and above.

Solaris 11.x and above.

#### 3.1.3 JVM

Oracle JDK 8–13.

IBM JDK 8.

OpenJDK 8–13.

#### 3.1.4 Application Server

WildFly Application Server 10.x.

WildFly Application Server 11.x.

WildFly Application Server 12.x.

WildFly Application Server 13.x.

WildFly Application Server 14.x.

WildFly Application Server 15.x.

WildFly Application Server 16.x.

WildFly Application Server 17.x.

WildFly Application Server 18.x.

#### 3.1.5 Database

| Database             | Minimum Version |
|----------------------|-----------------|
| DB2                  | 10.1            |
| H2                   | 1.3.174         |
| Microsoft SQL Server | 2008 R2 SP1     |

|                   |               |
|-------------------|---------------|
| <b>MySQL</b>      | 5.6.4         |
| <b>Oracle</b>     | 10.2 (10g R2) |
| <b>PostgreSQL</b> | 8.1           |

### 3.1.6 Database JDBC Driver

| Database                    | JDBC Driver  |
|-----------------------------|--|
| <b>DB2</b>                  | IBM DB2 JDBC 4.0 driver available at <a href="http://www-01.ibm.com/support/docview.wss?uid=swg21363866">http://www-01.ibm.com/support/docview.wss?uid=swg21363866</a> .   |
| <b>H2</b>                   | Database engine including the JDBC driver is available at <a href="http://www.h2database.com">http://www.h2database.com</a> .  |
| <b>Microsoft SQL Server</b> | Microsoft JDBC driver 4.0 for SQL Server available at <a href="http://msdn.microsoft.com/en-us/sqlserver/aa937724.aspx">http://msdn.microsoft.com/en-us/sqlserver/aa937724.aspx</a> .<br><br>We strongly advise against using the alternative JTDS JDBC driver because it does not support the datetime2 data type at this time. As a result, all datetime values written by QuartzDesk Web Application would end up rounded up, or down. For datetime data type rounding details, please refer to <a href="http://msdn.microsoft.com/en-us/library/ms187819.aspx">http://msdn.microsoft.com/en-us/library/ms187819.aspx</a> . |
| <b>MySQL</b>                | Connector/J JDBC driver available at <a href="http://dev.mysql.com/downloads/connector/j/">http://dev.mysql.com/downloads/connector/j/</a> .   |
| <b>Oracle</b>               | Oracle JDBC driver available at <a href="http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html">http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html</a> .<br><br>For a comprehensive overview of JDBC driver versions vs. supported database versions, please refer to <a href="http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-faq-090281.html#01_02">http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-faq-090281.html#01_02</a> .   |
| <b>PostgreSQL</b>           | JDBC4 PostgreSQL driver available at <a href="http://jdbc.postgresql.org/">http://jdbc.postgresql.org/</a> .   |

### 3.1.7 QuartzDesk Web Application Archive

To install QuartzDesk Web Application, you need to obtain the quartzdesk-web-x.y.z.war file. The latest version can be downloaded at [www.quartzdesk.com](http://www.quartzdesk.com) (click Downloads → Latest Release → View files → quartzdesk-web-x.y.z.war).

## 3.2 Hardware Requirements

QuartzDesk Web Application runs on any physical or virtualized hardware that supports the above software requirements.

## 4. Installation

This chapter describes the standard QuartzDesk Web Application installation. If you are only evaluating, you can run QuartzDesk Web Application in the **one-step installation mode** to dramatically reduce the number of required installation steps. For details, please see our [FAQs](#) and search for “one-step installation”.

### 4.1 Database

Create a new database user named `quartzdesk` (DB\_USER) with an arbitrary password (DB\_PASSWORD).

Create a new QuartzDesk Web Application database named `quartzdesk1` (DB\_NAME) owned by DB\_USER.

In the `quartzdesk` database create a new schema named `quartzdesk` (DB\_SCHEMA). The schema must be owned by DB\_USER. Make the created DB\_SCHEMA the default schema of DB\_USER and/or add the schema to the DB\_USER's schema search path.

Please contact your DBA, or refer to the database engine documentation for instructions on how to complete the above database-specific tasks.

Please note that you do not have to create any database objects (tables, keys, indices etc.) in the `quartzdesk` database / schema. These objects will be automatically created by QuartzDesk Web Application during its first start.

### 4.2 JDBC Driver

Download and install the JDBC driver for the created database. For a list of supported JDBC drivers please refer to chapter 3.1.6.

Copy the JDBC driver JAR file(s) to `WFAS_INSTALL_ROOT/WFAS_CONFIG/deployments` directory and restart the application server.

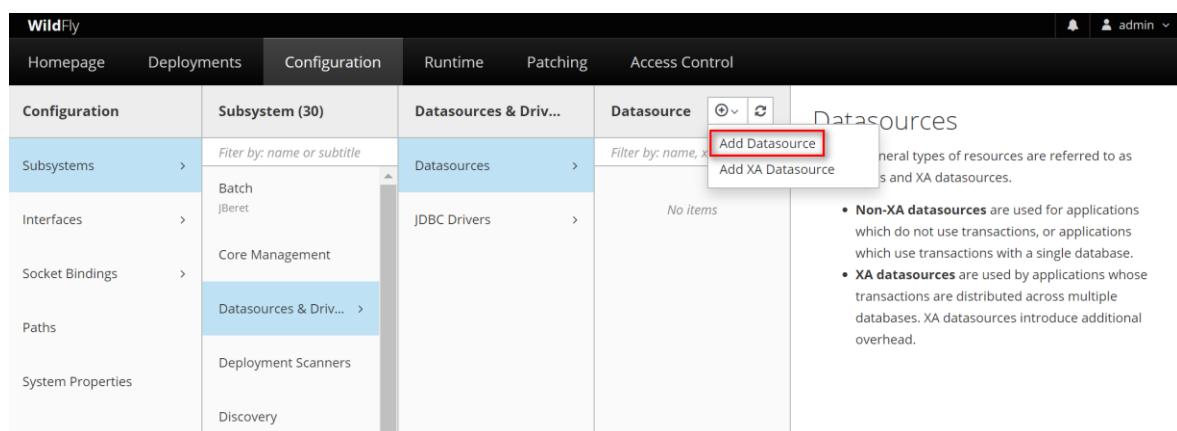

To install the H2 JDBC driver, do not copy it to `WFAS_INSTALL_ROOT/WFAS_CONFIG/deployments` directory because the H2 driver is already installed as a module (`JAS_INSTALL_ROOT/modules/system/layers/base/com/h2database/h2`). To update the existing driver module JAR, copy the new H2 driver JAR to the module's main directory and edit the module descriptor file `module.xml` to update the JAR name.

### 4.3 JDBC Datasource

In WFAC select Configuration → Subsystems → Datasources & Drivers → Datasources and click the Add button in the Datasource column and select the Add Datasource menu option to create a new JDBC datasource.

---

<sup>1</sup> If you use DB2, the database name length is restricted to the maximum of 8 characters. Please adjust the database name accordingly (e.g. qdesk).

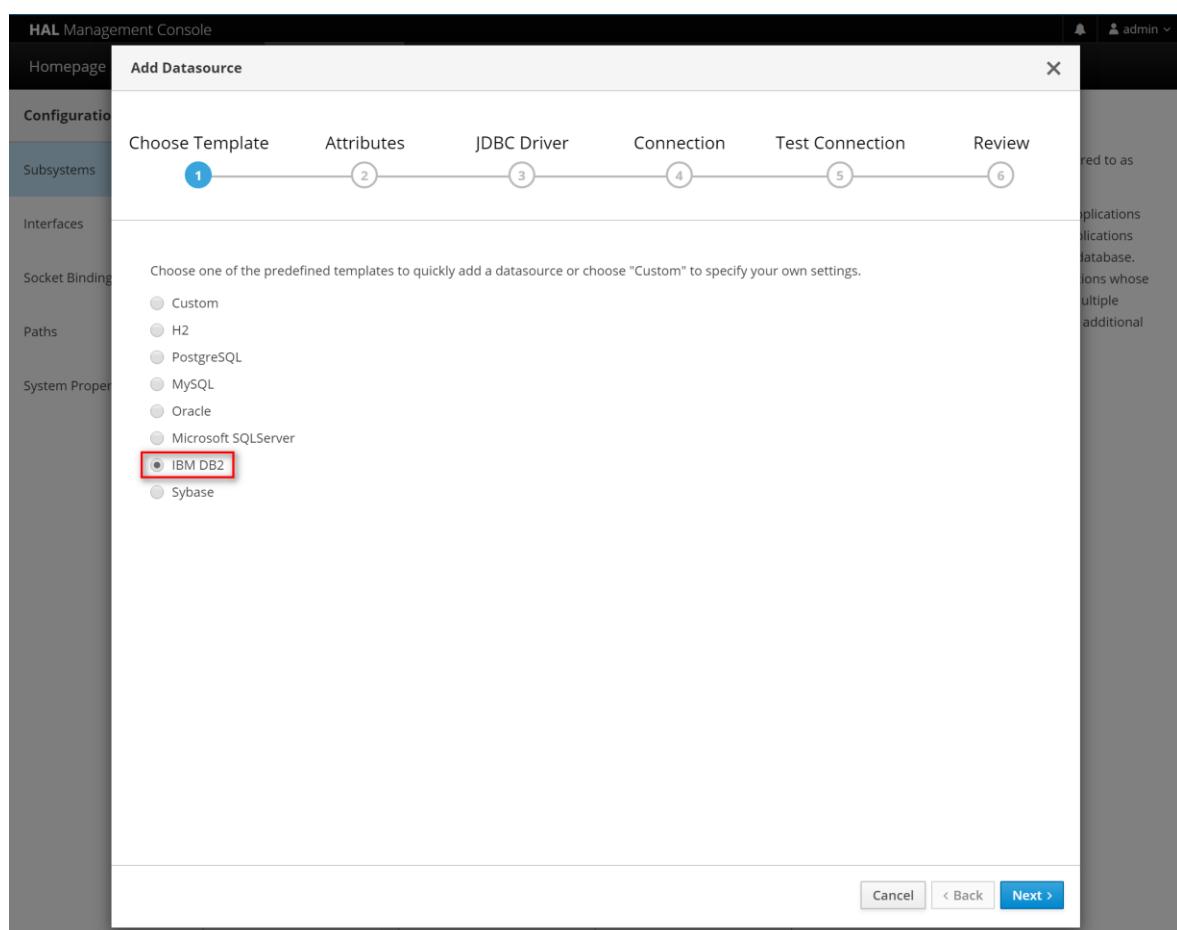

The screenshot shows the WildFly Configuration interface under the 'Configuration' tab. In the 'Subsystems' section, 'Datasources & Driv...' is selected. On the right, there is a 'Datasources' panel with a 'No items' message. At the top of this panel, there is a 'Datasource' toolbar with a 'Add Datasource' button, which is highlighted with a red box.

The next steps depend on the QuartzDesk Web Application database type and are described in the following sub-chapters.

#### 4.3.1 DB2

In the Create Datasource dialog, select the IBM DB2 option.

The screenshot shows the HAL Management Console 'Add Datasource' dialog. The left sidebar shows 'Configuration' selected. The main area has a title 'Add Datasource' and a progress bar with six steps: 1. Choose Template, 2. Attributes, 3. JDBC Driver, 4. Connection, 5. Test Connection, 6. Review. Step 1 is highlighted with a blue circle. Below the steps, it says 'Choose one of the predefined templates to quickly add a datasource or choose "Custom" to specify your own settings.' A list of templates follows, with 'IBM DB2' selected and highlighted with a red box. Other options include Custom, H2, PostgreSQL, MySQL, Oracle, Microsoft SQLServer, and Sybase. At the bottom are 'Cancel', '< Back', and a blue 'Next >' button.

Click Next.

In Step 2, enter the following datasource attributes:

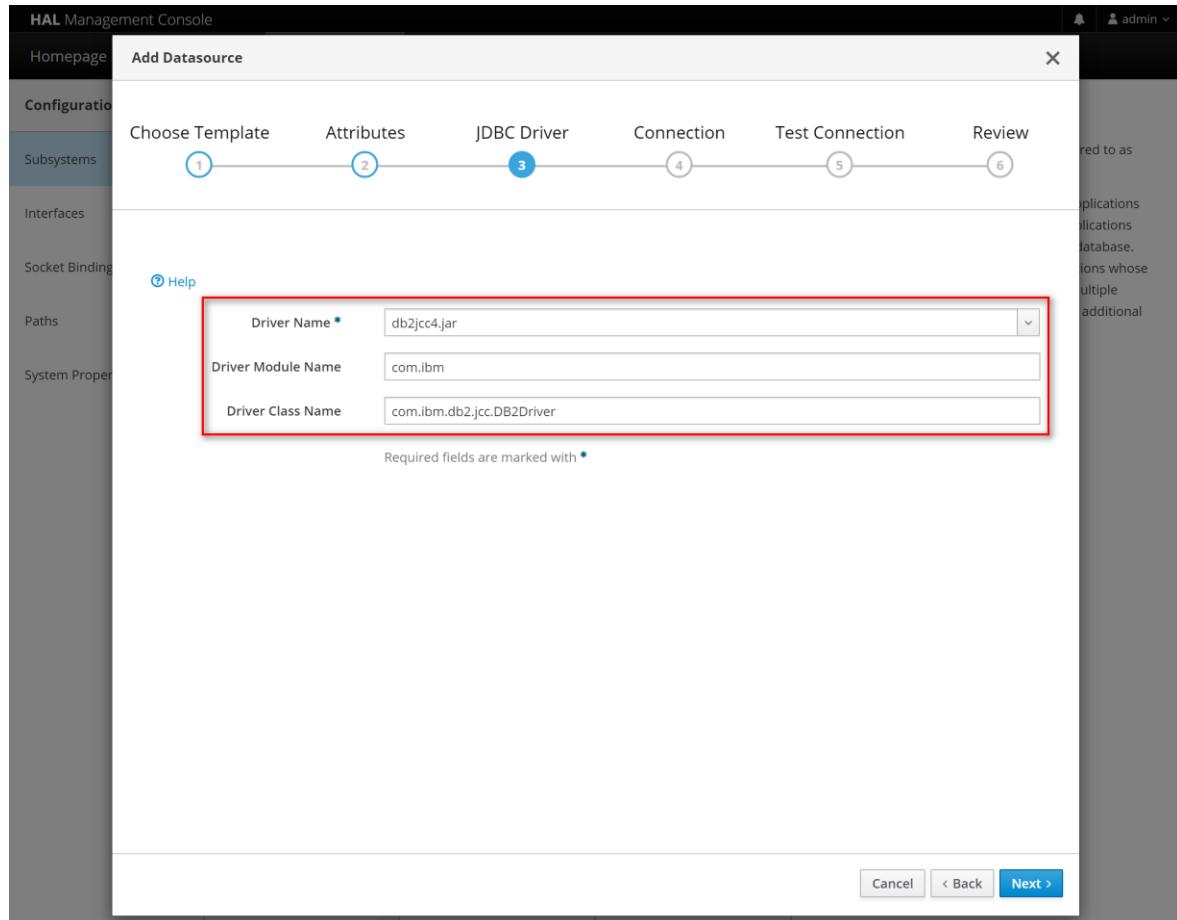

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed DB2 JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: com.ibm

Driver Class Name: com.ibm.db2.jcc.DB2Driver

The screenshot shows the 'Add Datasource' wizard in the HAL Management Console. The 'JDBC Driver' step is selected (indicated by a blue circle). A red box highlights the 'Driver Name' input field, which contains 'db2jcc4.jar'. Below it, the 'Driver Module Name' is set to 'com.ibm' and the 'Driver Class Name' is set to 'com.ibm.db2.jcc.DB2Driver'. The sidebar on the left shows the navigation menu with 'Subsystems' selected.

Click Next.

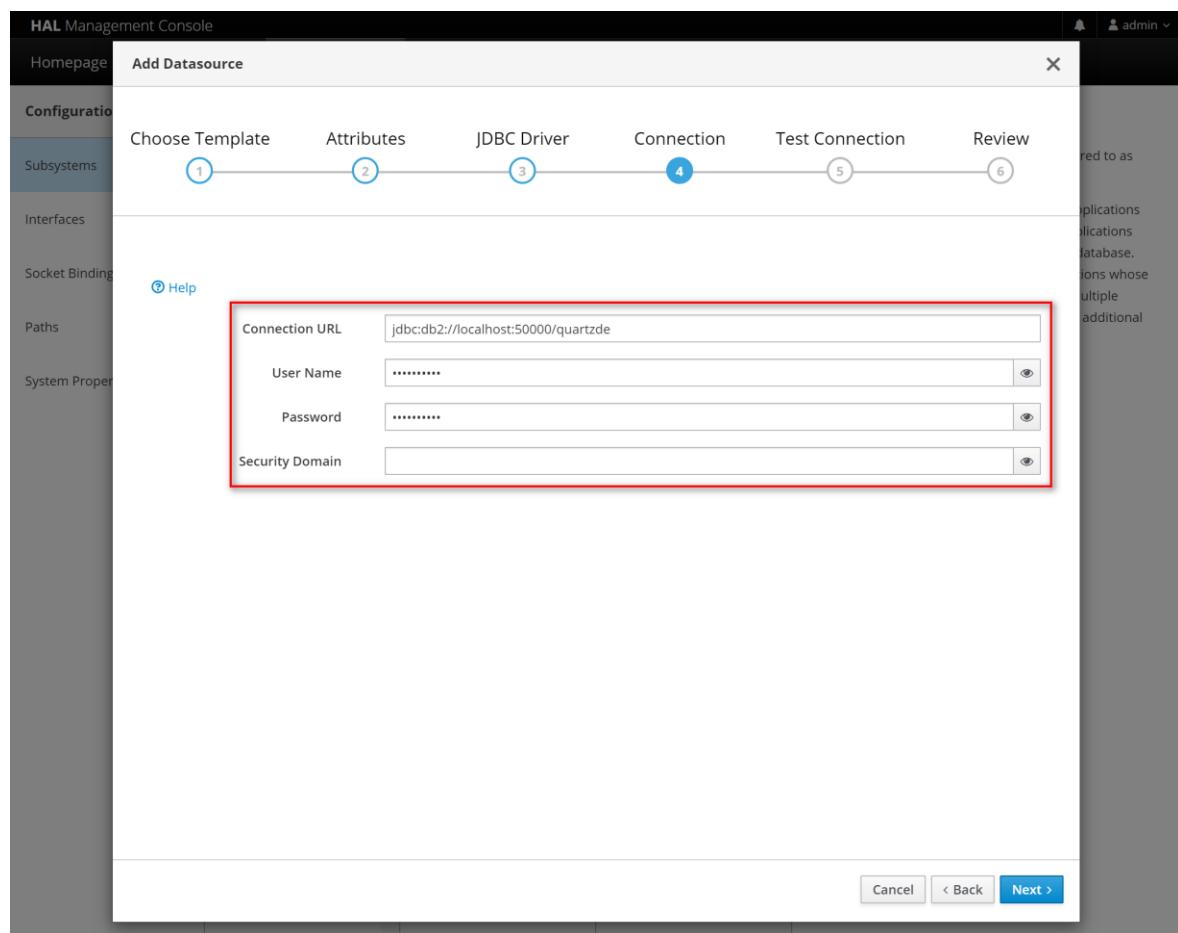

In Step 4, enter the following values:

Connection URL: jdbc:db2://DB\_HOST:DB\_PORT/DB\_NAME

Username: DB\_USER

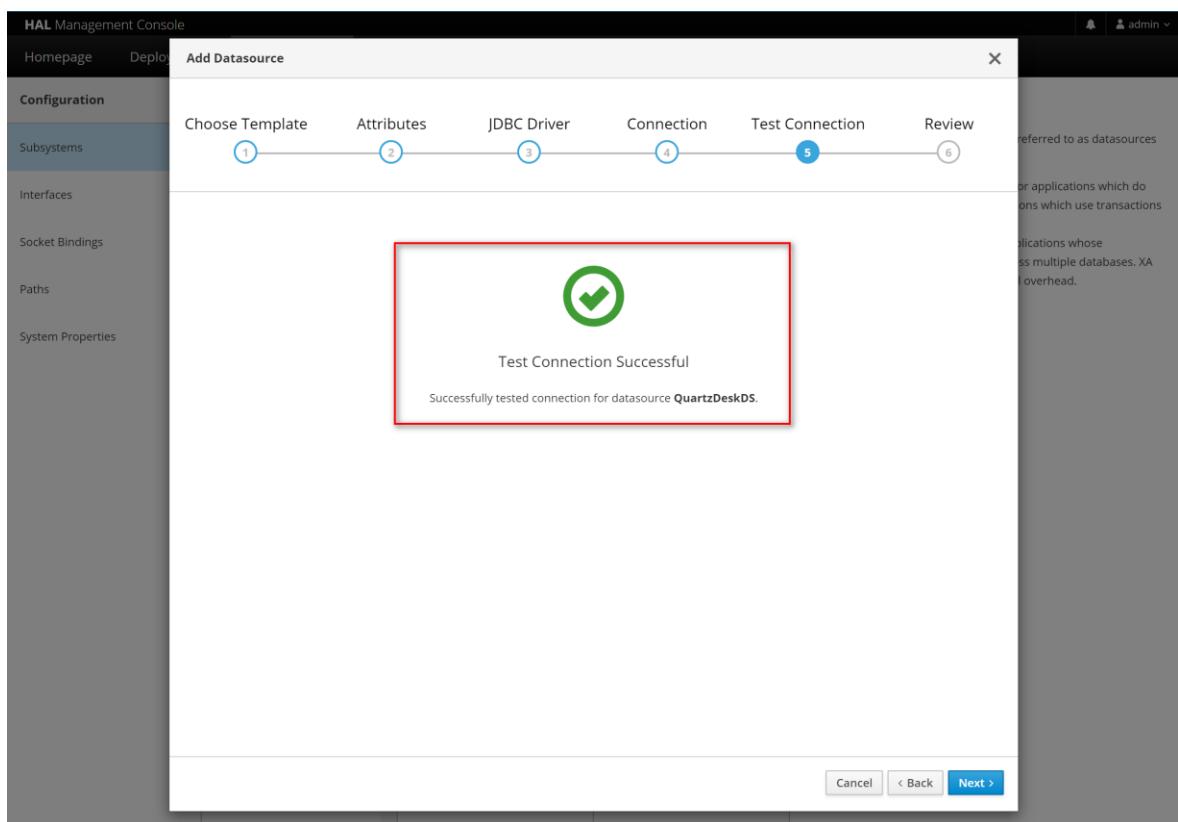

Password: DB\_PASSWORD

Security Domain: leave empty

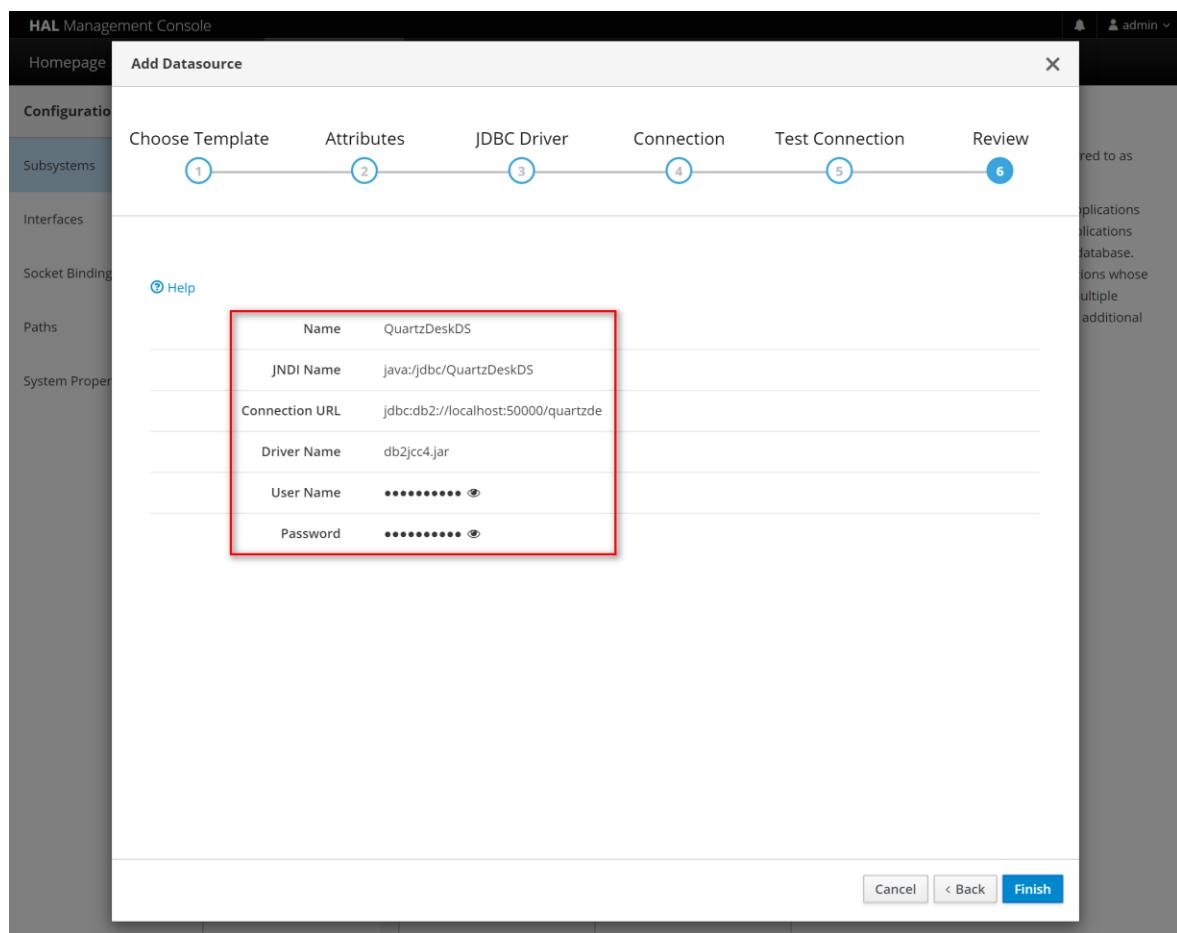

Click Next.

In Step 5, test the datasource by clicking on the Test Connection button.

Click Next.

In Step 6, review the datasource parameters.

Click Finish.

Select the registered QuartzDeskDS datasource, click View and modify the datasource configuration under the following tabs:

### Connection

Add the following property:

`clientApplicationInformation=QuartzDesk Web Application`

Click Save.

### Pool

Click the Edit button and enter the following values:

Initial Pool Size: 2

Min Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.db2.DB2ValidConnectionChecker`

Stale Connection Checker Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.db2.DB2StaleConnectionChecker`

Exception Sorter Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.db2.DB2ExceptionSorter`

Click Save.

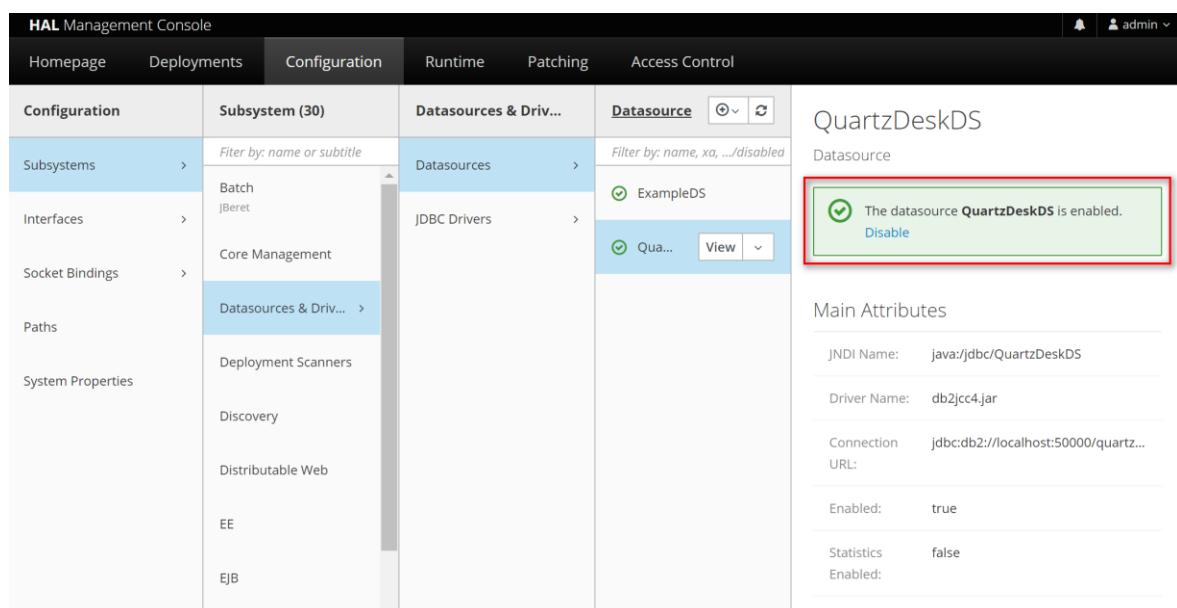

### Statements / Tracking

Click the Edit button and enter the following values:

Prepared Statements Cache Size: 100

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

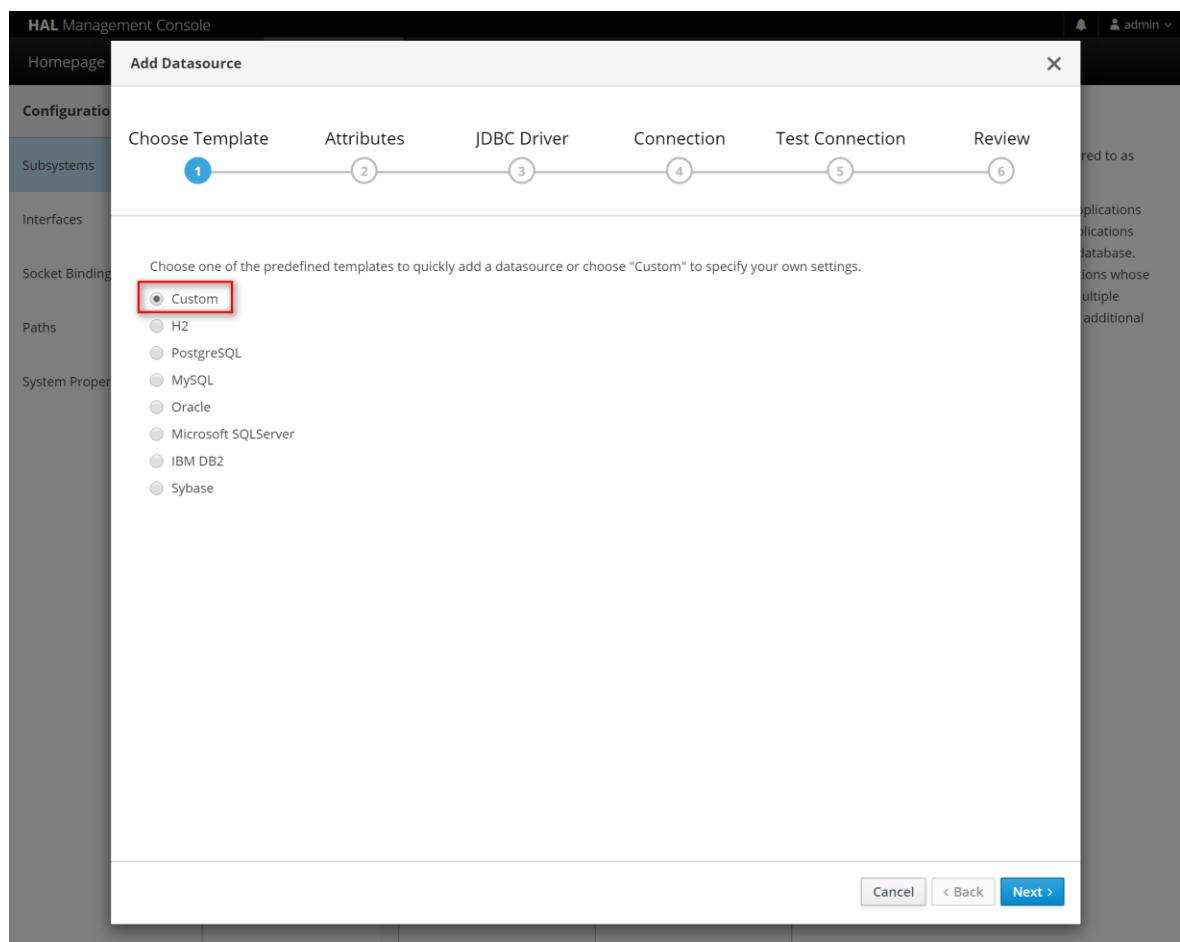

The screenshot shows the HAL Management Console interface. The top navigation bar includes 'Homepage', 'Deployments', 'Configuration' (which is the active tab), 'Runtime', 'Patching', and 'Access Control'. On the left, a sidebar lists 'Subsystems', 'Interfaces', 'Socket Bindings', 'Paths', and 'System Properties'. Under 'Paths', 'Datasources & Driv...' is selected. The main content area shows a tree view of 'Datasources' and 'JDBC Drivers'. Under 'Datasources', 'ExampleDS' and 'QuartzDeskDS' are listed, with 'QuartzDeskDS' being checked. To the right, a detailed view of 'QuartzDeskDS' is shown with the following attributes:

| Main Attributes     |                                      |
|---------------------|--------------------------------------|
| JNDI Name:          | java:jdbc/QuartzDeskDS               |
| Driver Name:        | db2jcc4.jar                          |
| Connection URL:     | jdbc:db2://localhost:50000/quartz... |
| Enabled:            | true                                 |
| Statistics Enabled: | false                                |

### 4.3.2 H2

 H2 is a light-weight Java database with limited fault tolerance and recovery functionality.  
We recommend using H2 for evaluation and experimental purposes only.

In the Create Datasource dialog, select the Custom option.

Click Next.

In Step 2, enter the following datasource attributes:

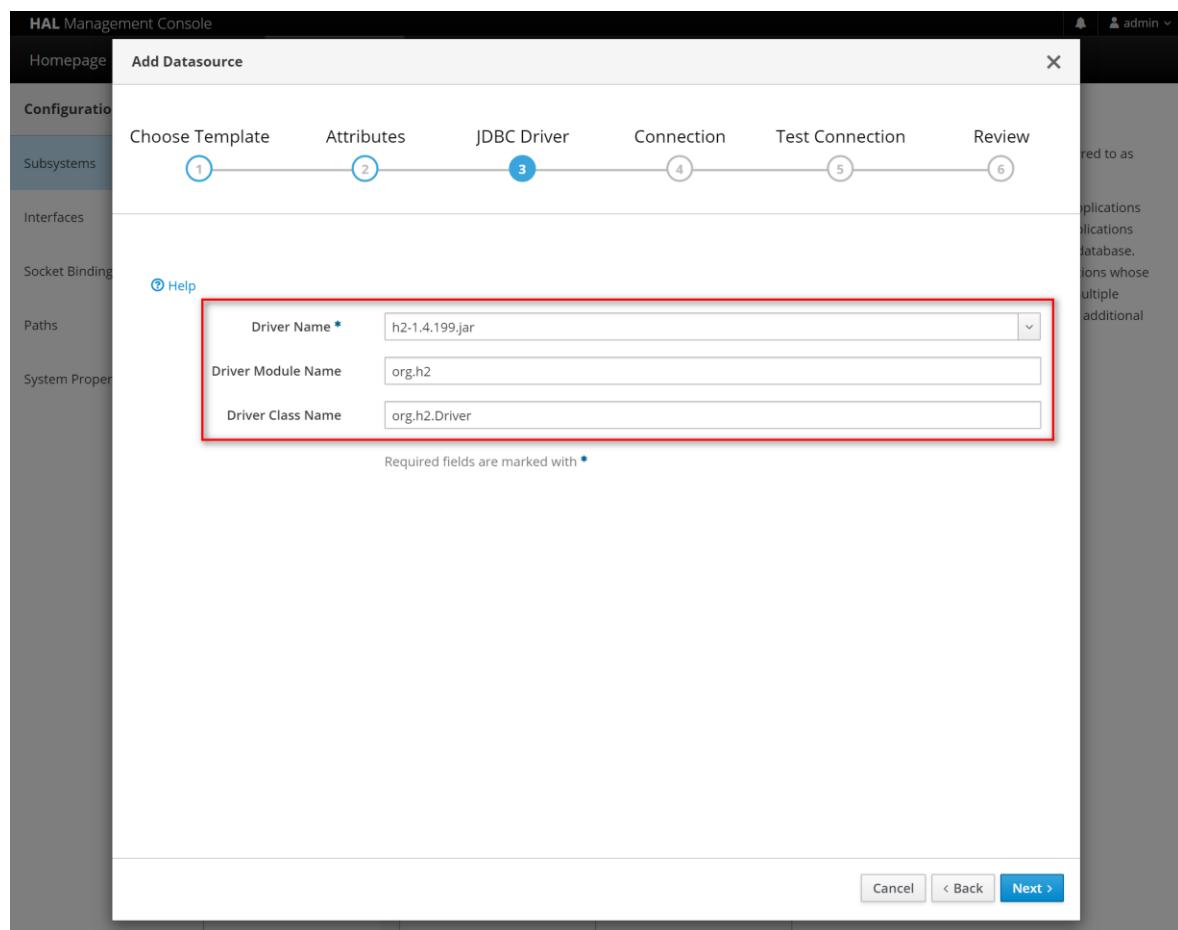

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed H2 JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: org.h2

Driver Class Name: org.h2.Driver

Click Next.

In Step 4, enter the following values:

Connection URL: `jdbc:h2:file:<H2_DB_FILE_PATH>`

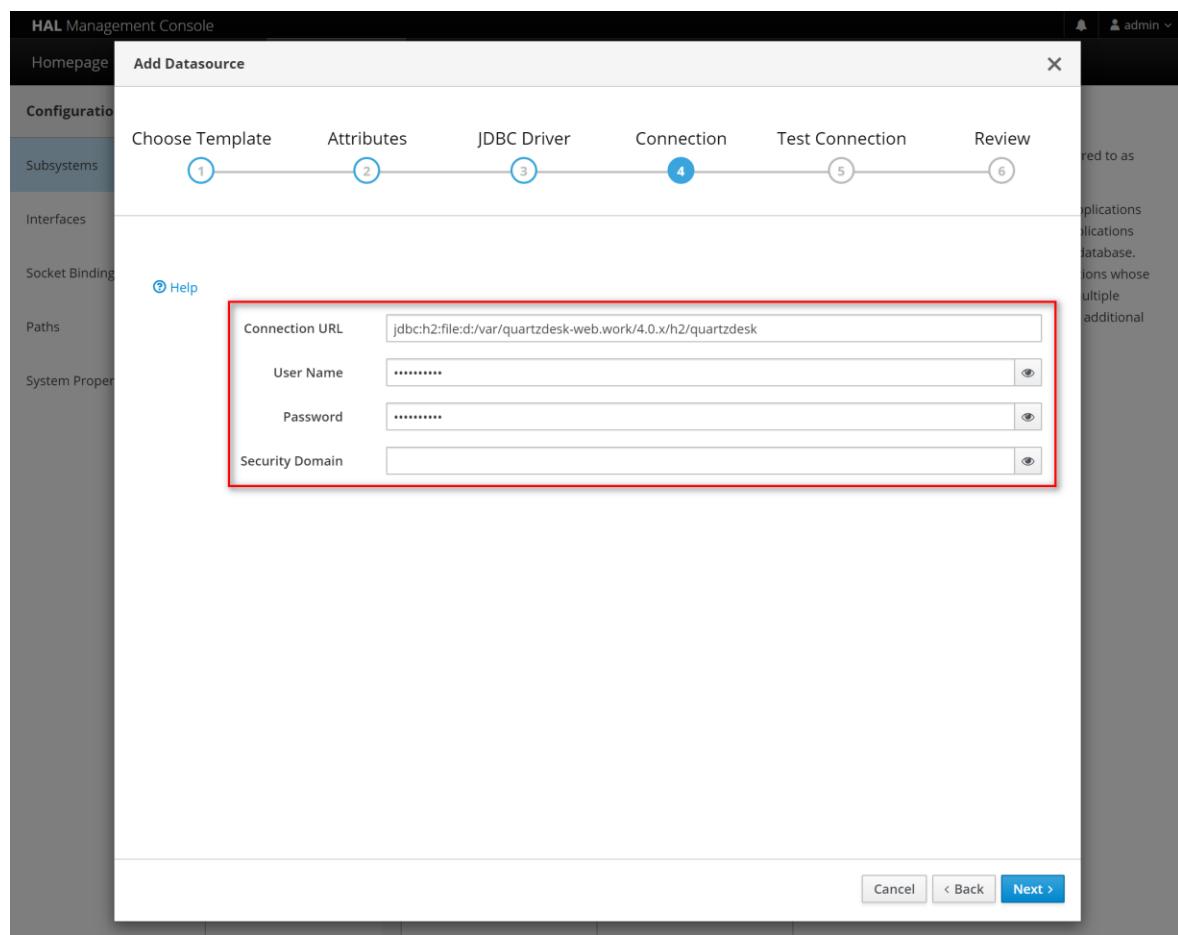

Username: DB\_USER

Password: DB\_PASSWORD

Security Domain: leave empty

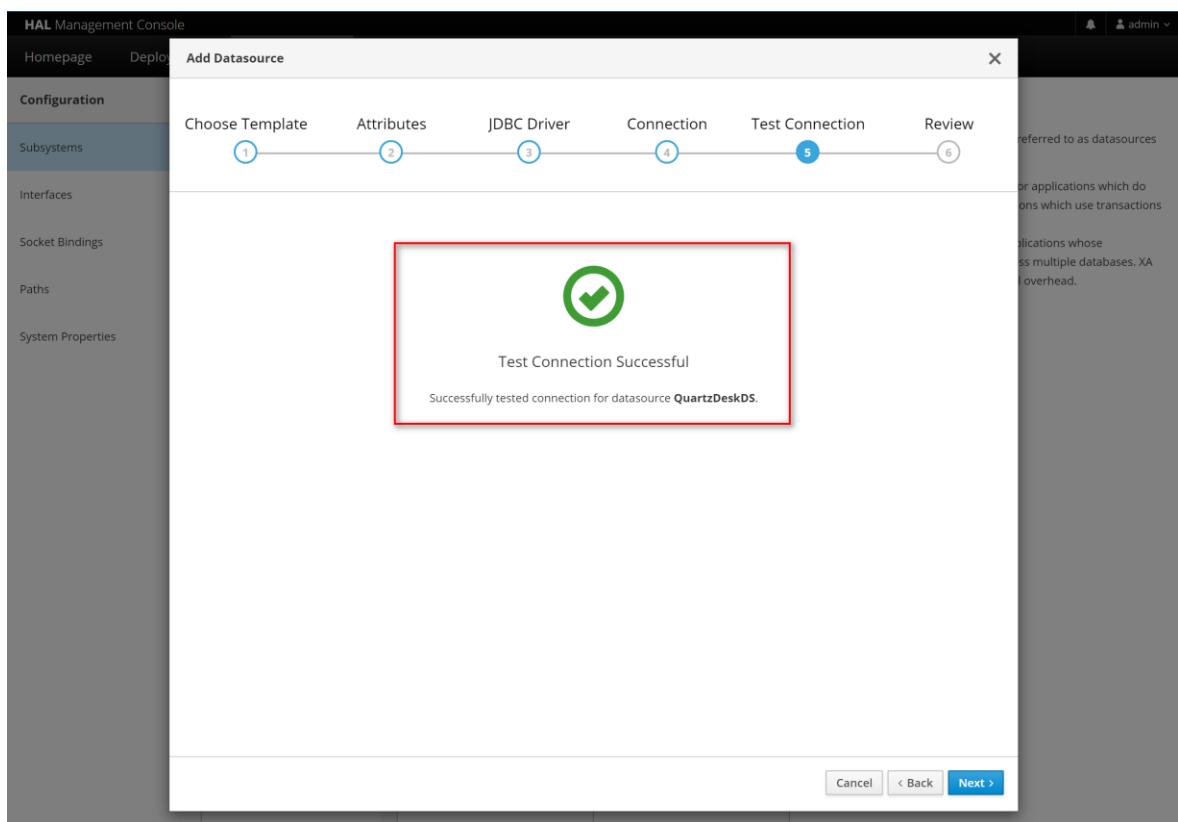

Please note that H2 can be configured to run in various operating modes by adjusting the Connection URL value. For details, please refer to the H2 documentation at

[http://www.h2database.com/html/features.html#database\\_url](http://www.h2database.com/html/features.html#database_url).

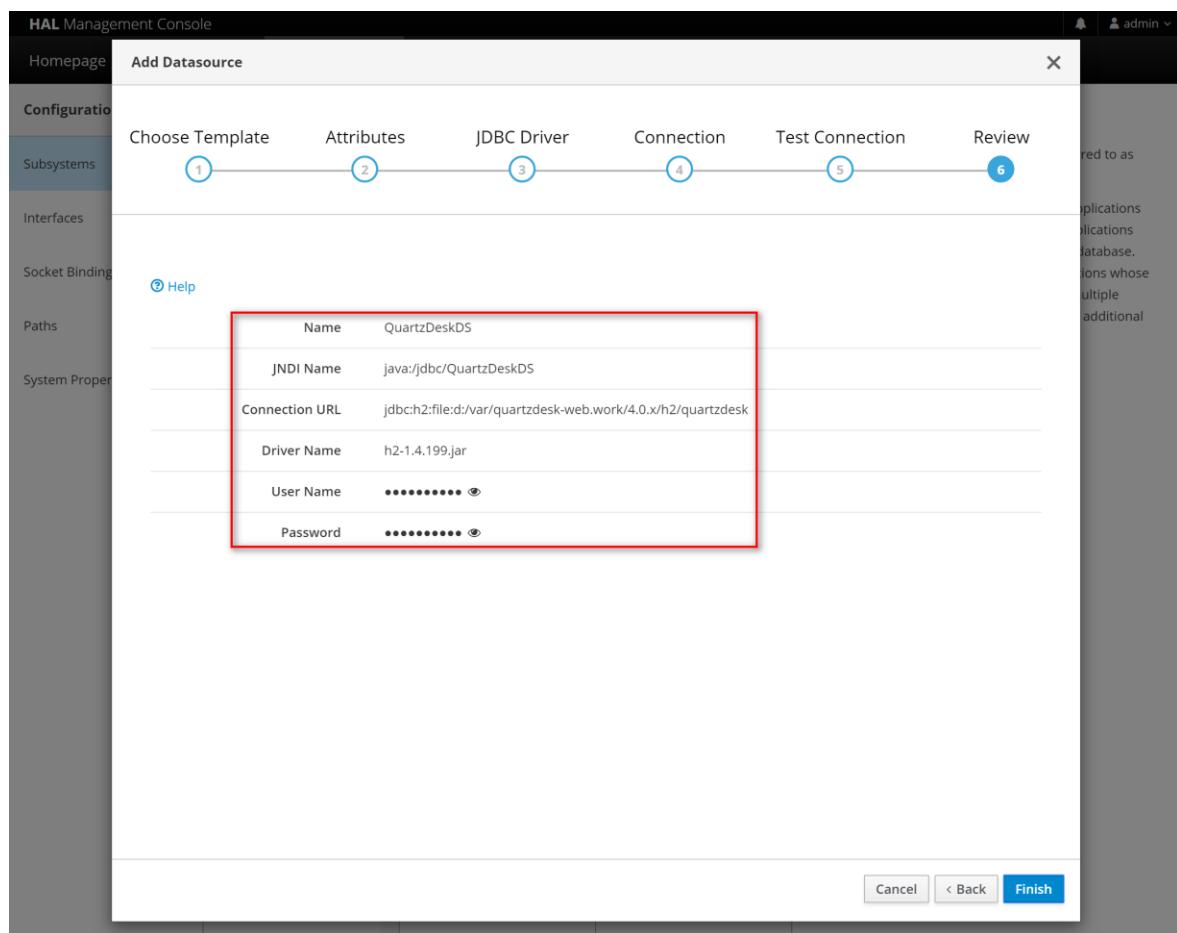

Click Next.

In Step 5, test the datasource by clicking on the Test Connection button.

Click Next.

In Step 6, review the datasource parameters.

Click Finish.

Select the registered QuartzDeskDS datasource, click View and modify the datasource configuration under the following tabs:

### Connection

Add the following property:

applicationName=QuartzDesk Web Application

Click Save.

### Pool

Click the Edit button and enter the following values:

Initial Pool Size: 2

Min Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.novendor.JDBC4ValidConnectionChecker`

Stale Connection Checker Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.novendor.NullStaleConnectionChecker`

Exception Sorter Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.novendor.NullExceptionSorter`

Click Save.

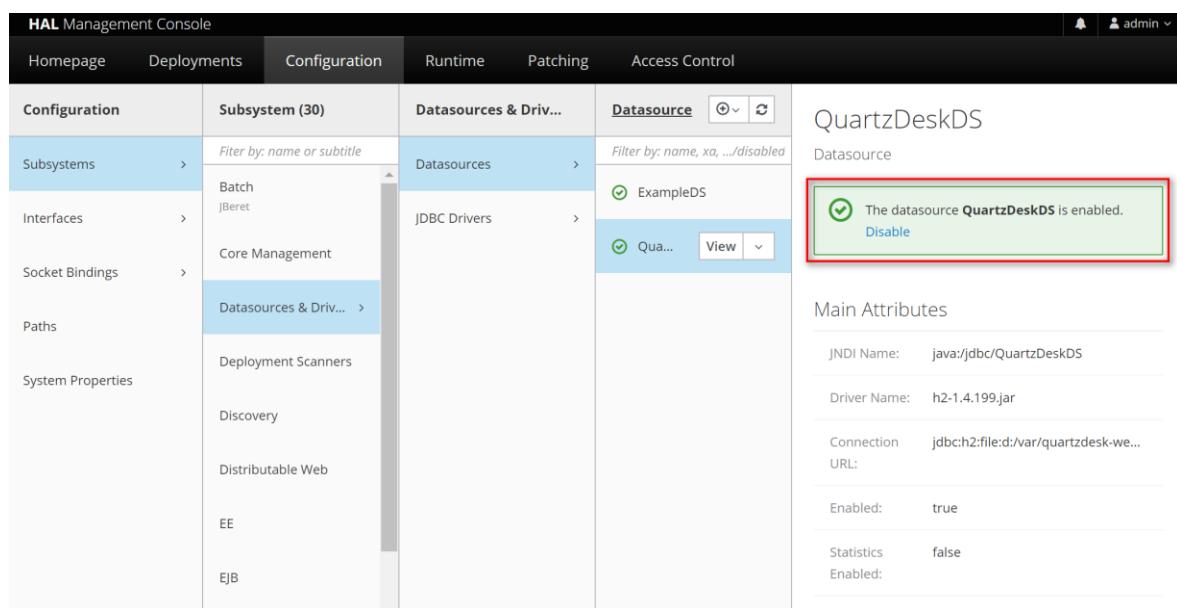

### Statements / Tracking

Click the Edit button and enter the following values:

Prepared Statements Cache Size: 100

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

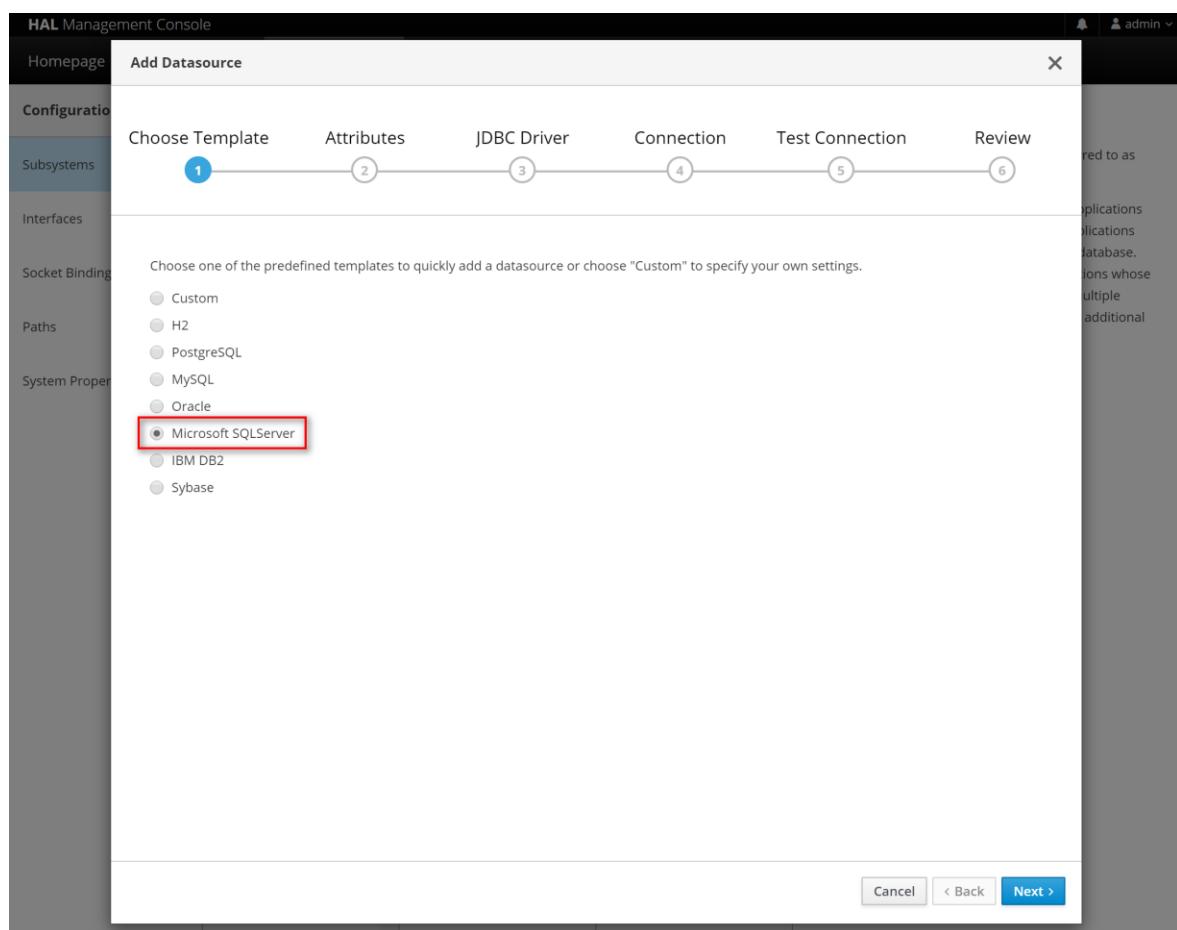

The screenshot shows the HAL Management Console interface. The left sidebar has sections for Configuration, Subsystems, Interfaces, Socket Bindings, Paths, and System Properties. Under Configuration, the Subsystem section is expanded, showing Batch, jBeret, Core Management, and Datasources & Driv... (which is also highlighted with a blue box). The main content area shows a list of Datasources under the JDBC Drivers section. One datasource, ExampleDS, is selected. A message box indicates that the datasource **QuartzDeskDS** is enabled. To the right, the details for the QuartzDeskDS datasource are listed, including its Main Attributes: JNDI Name (java:/jdbc/QuartzDeskDS), Driver Name (h2-1.4.199.jar), Connection URL (jdbc:h2:file:d:/var/quartzdesk-we...), Enabled (true), Statistics (false), and Enabled (false).

| Main Attributes                                      |
|--|
| JNDI Name: java:/jdbc/QuartzDeskDS                   |
| Driver Name: h2-1.4.199.jar                          |
| Connection URL: jdbc:h2:file:d:/var/quartzdesk-we... |
| Enabled: true  |
| Statistics: false                                    |
| Enabled: false                                       |

### 4.3.3 Microsoft SQL Server

In the Create Datasource dialog, select the Microsoft SQLServer option.

Click Next.

In Step 2, enter the following datasource attributes:

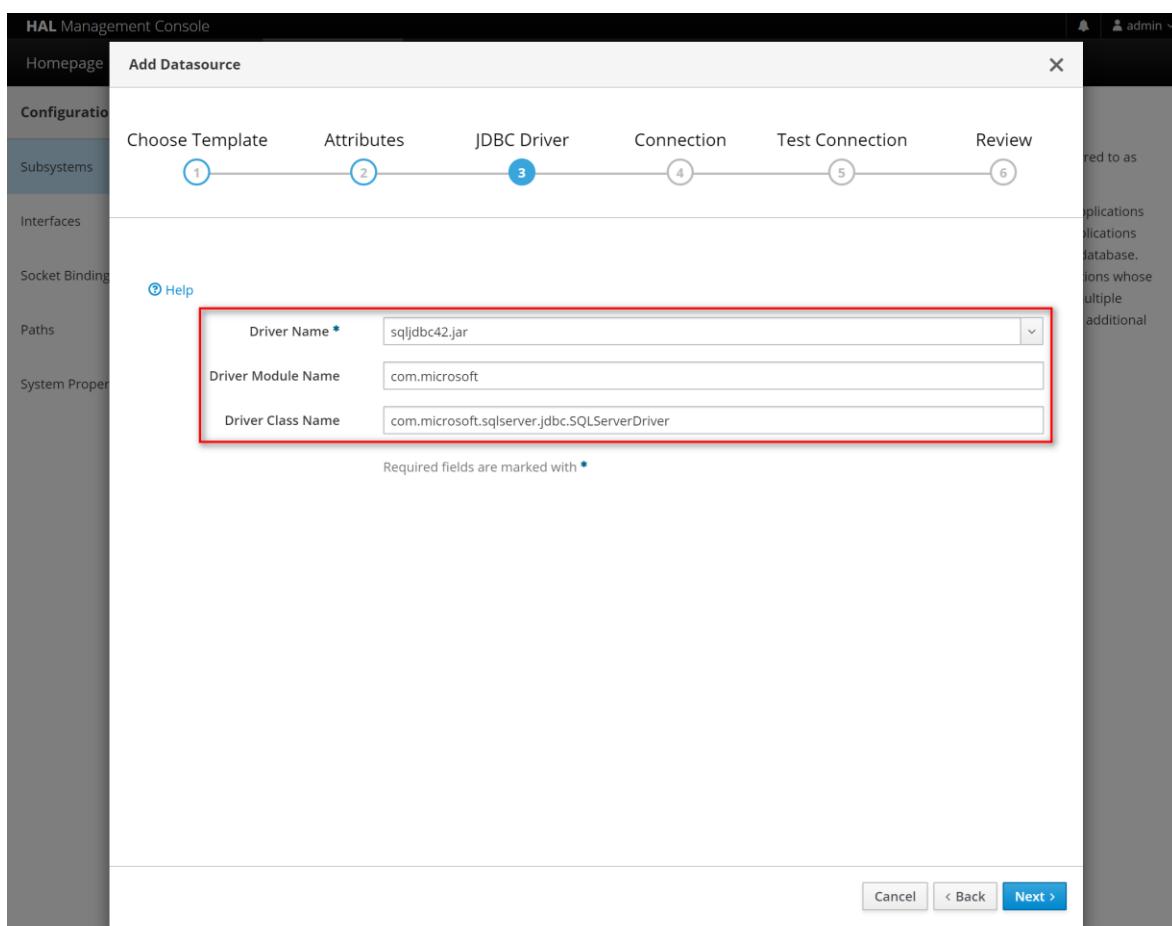

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed Microsoft SQL Server JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: com.microsoft

Driver Class Name: com.microsoft.sqlserver.jdbc.SQLServerDriver

Click Next.

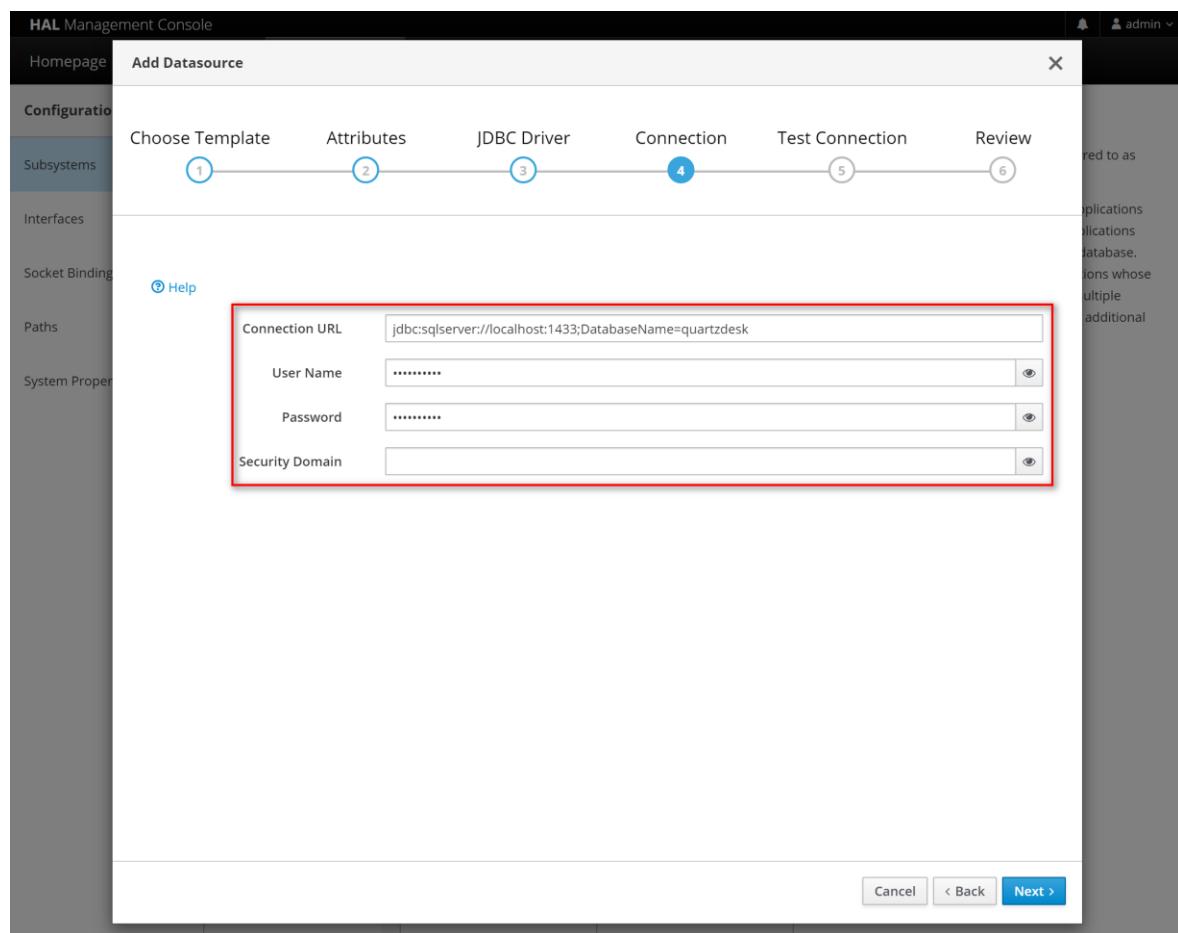

In Step 4, enter the following values:

Connection URL: jdbc:sqlserver://DB\_HOST:DB\_PORT;DatabaseName=DB\_NAME

Username: DB\_USER

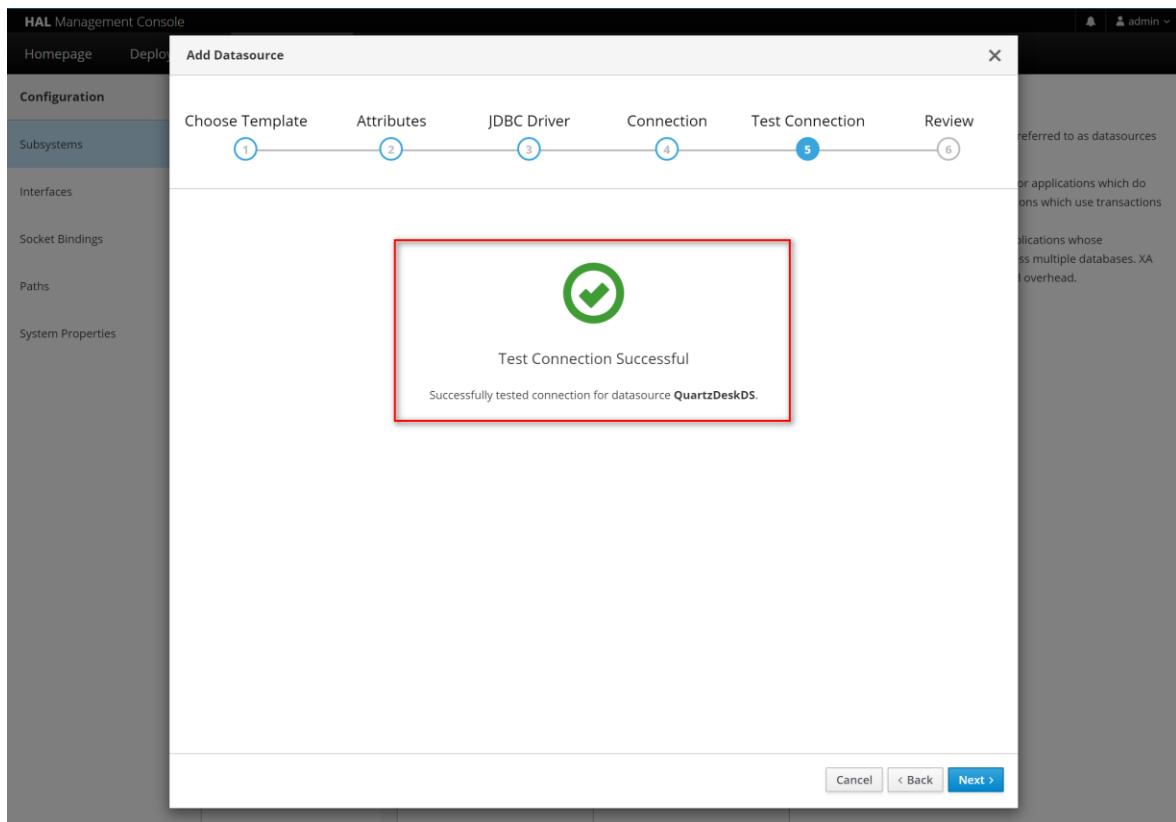

Password: DB\_PASSWORD

Security Domain: leave empty

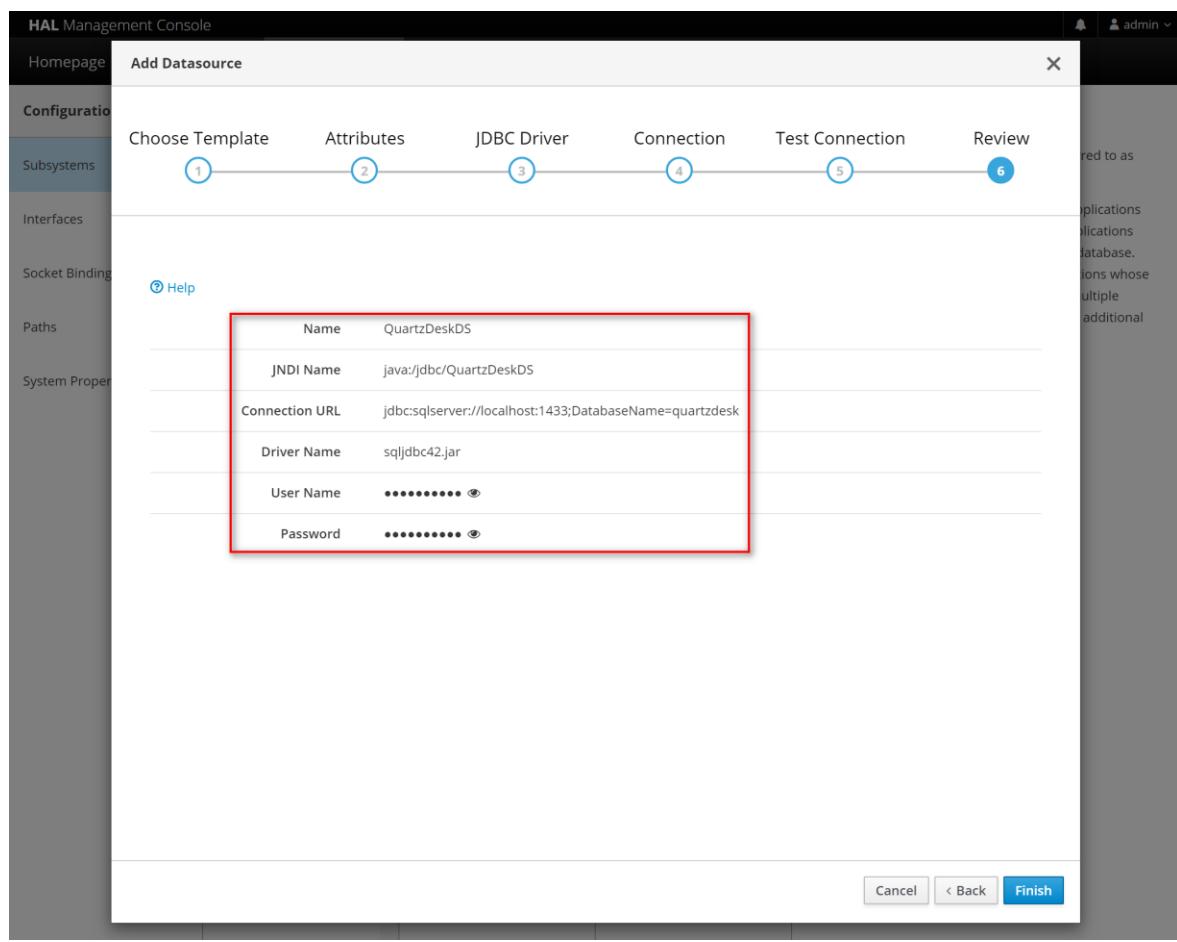

Click Next.

In Step 5, test the datasource by clicking on the Test Connection button.

Click Next.

In Step 6, review the datasource parameters.

Click Finish.

Select the registered QuartzDeskDS datasource, click View and modify the datasource configuration under the following tabs:

### Connection

Add the following property:

applicationName=QuartzDesk Web Application

Click Save.

### Pool

Click the Edit button and enter the following values:

Initial Pool Size: 2

Min Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

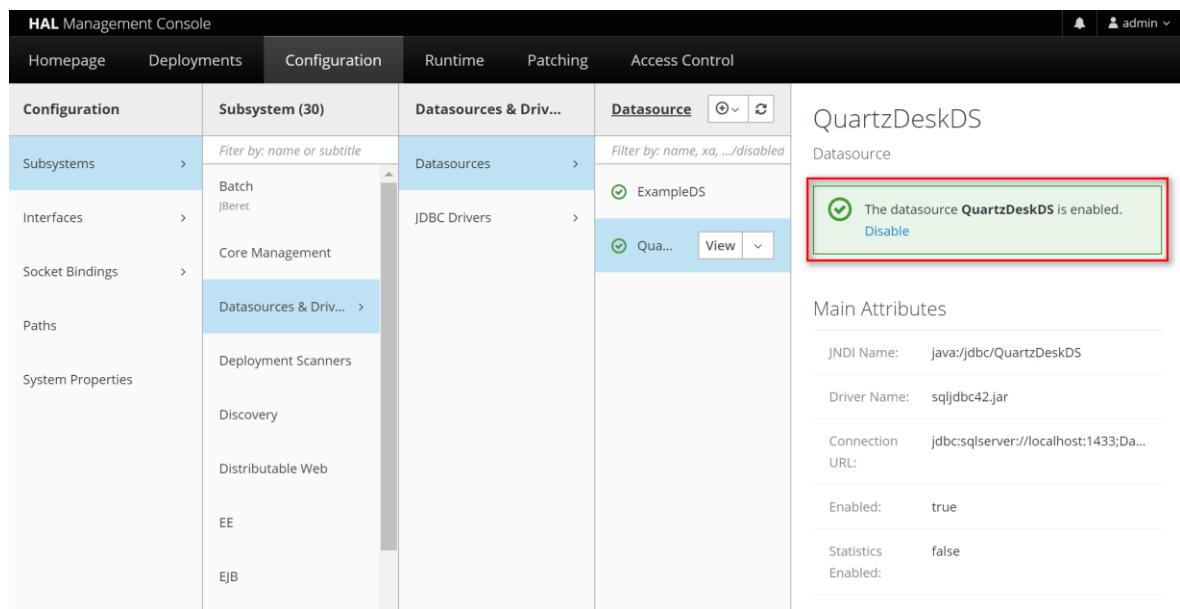

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:  
`org.jboss.jca.adapters.jdbc.extensions.mssql.MSSQLValidConnectionChecker`

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

The screenshot shows the HAL Management Console interface. The top navigation bar has tabs for Homepage, Deployments, Configuration (which is selected), Runtime, Patching, and Access Control. On the far right, there's a bell icon and a user dropdown for 'admin'. The main content area has a sidebar on the left with sections like Subsystems, Interfaces, Socket Bindings, Paths, and System Properties. Under Subsystems, 'Datasources & Driv...' is expanded. In the center, there's a 'Datasources' list with 'ExampleDS' and 'QuartzDeskDS' (which is highlighted with a red box). To the right, there's a panel for 'QuartzDeskDS' with sections for Main Attributes, including JNDI Name, Driver Name, Connection URL, and various boolean settings like Enabled and Statistics.

QuartzDeskDS

Datasource

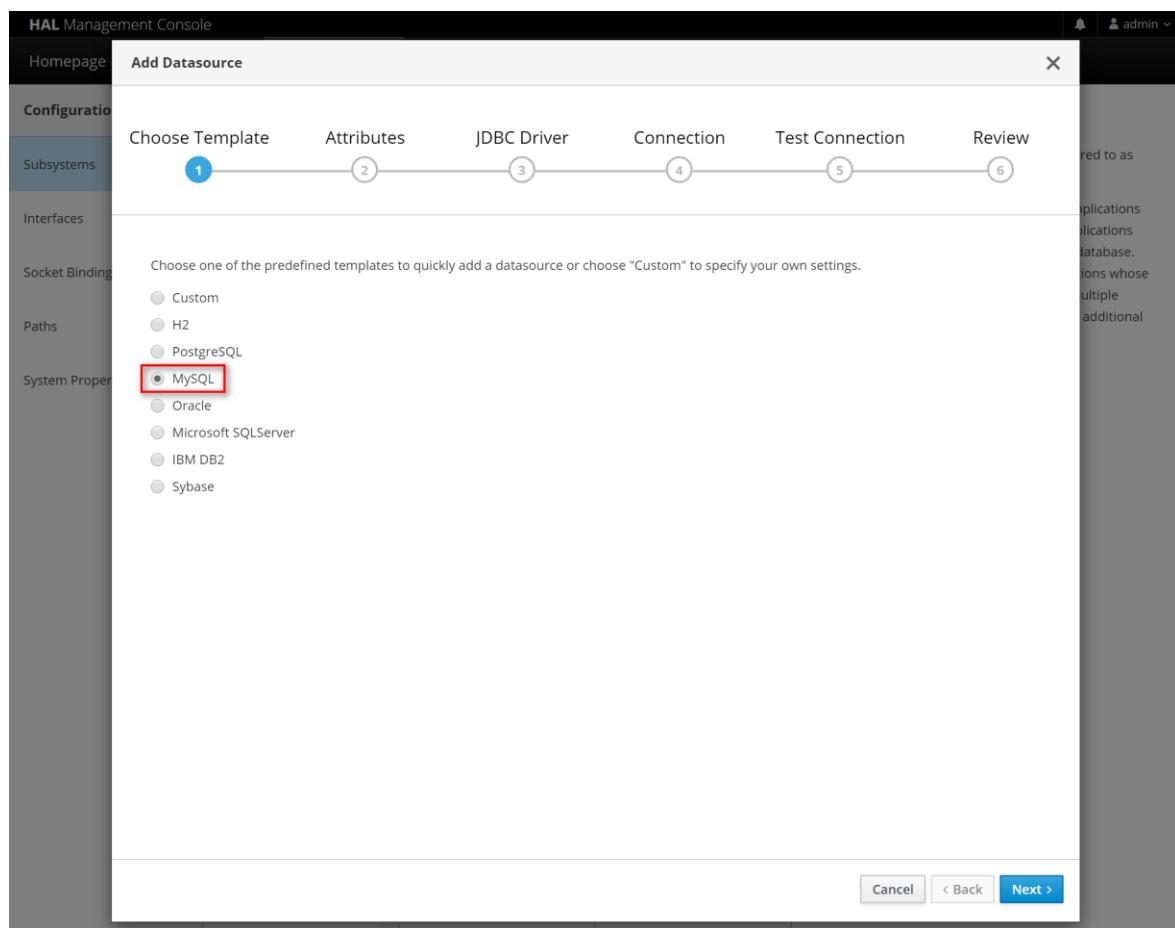

The datasource **QuartzDeskDS** is enabled.  
[Disable](#)

Main Attributes

|                 |                                       |
|-----------------|---------------------------------------|
| JNDI Name:      | java:/jdbc/QuartzDeskDS               |
| Driver Name:    | sqldbc42.jar                          |
| Connection URL: | jdbc:sqlserver://localhost:1433;Da... |
| Enabled:        | true                                  |
| Statistics      | false                                 |
| Enabled:        | false                                 |

#### 4.3.4 MySQL

In the Create Datasource dialog, select the MySQL option.

Click Next.

In Step 2, enter the following datasource attributes:

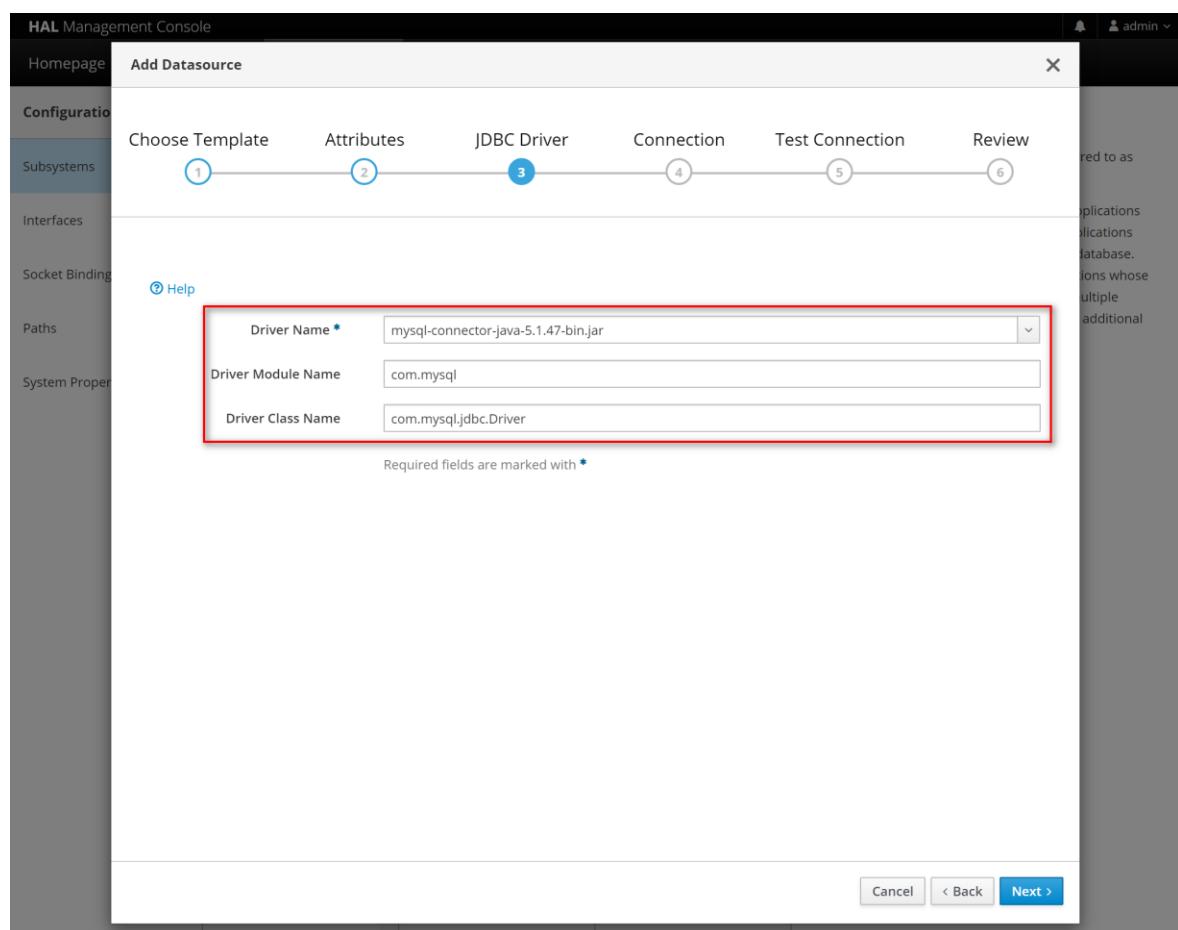

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed MySQL JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: org.mysql

Driver Class Name: org.mysql.jdbc.Driver

Click Next.

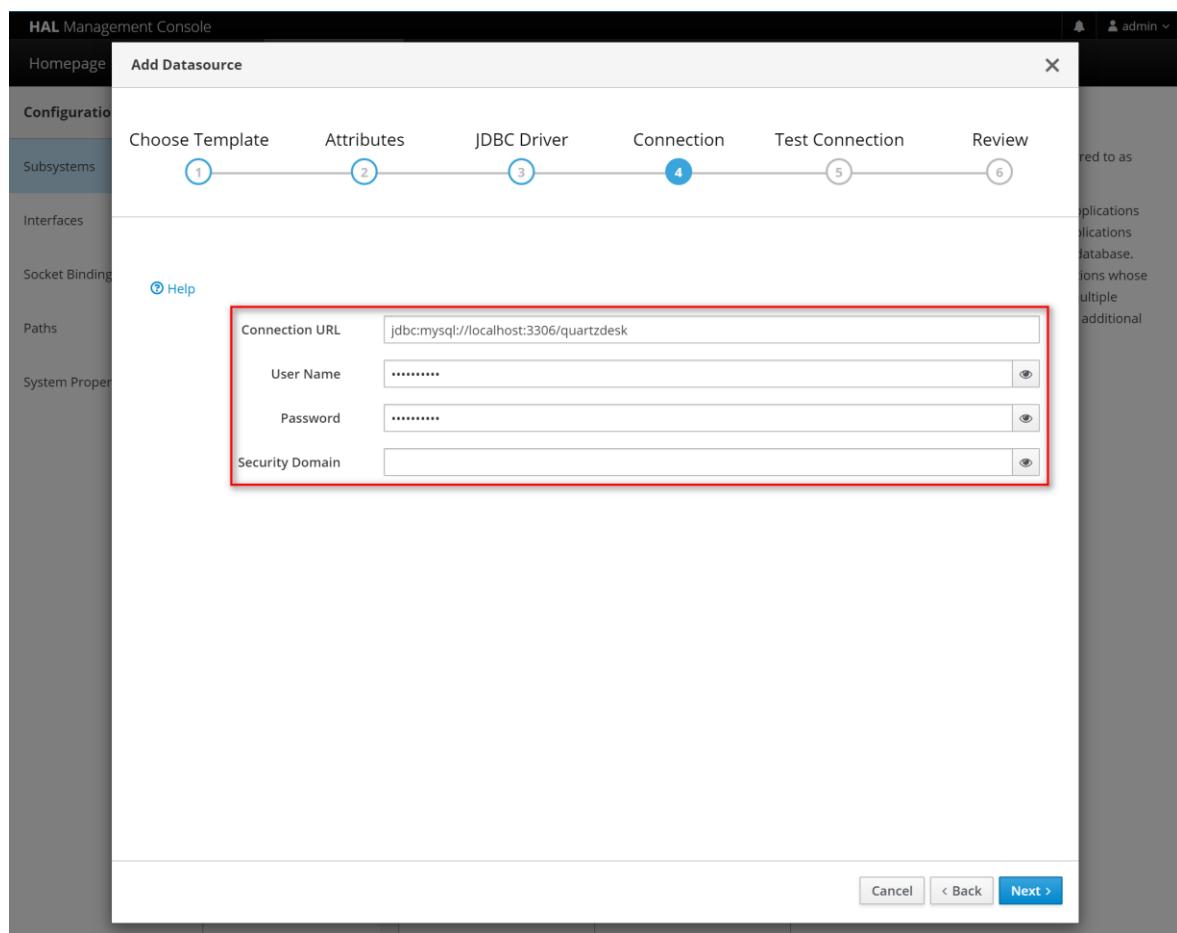

In Step 4, enter the following values:

Connection URL: `jdbc:mysql://DB_HOST:DB_PORT/DB_NAME`

Username: `DB_USER`

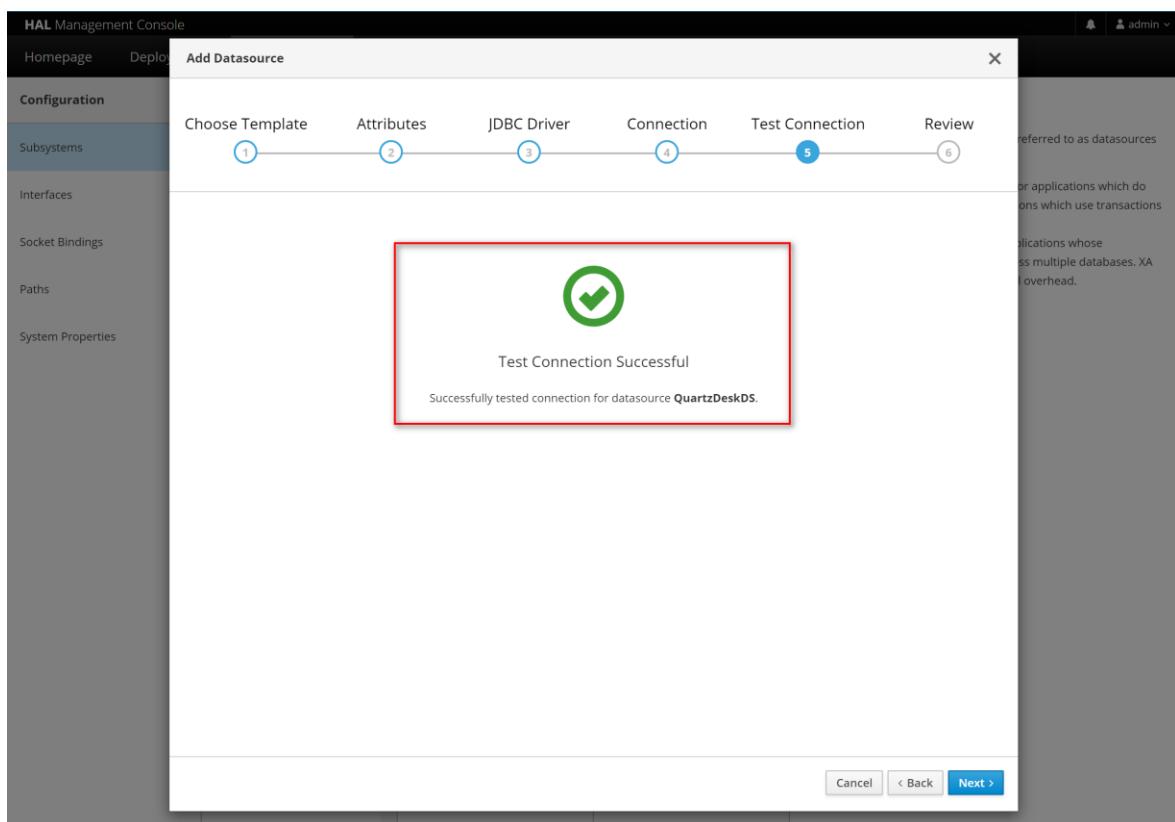

Password: `DB_PASSWORD`

Security Domain: leave empty

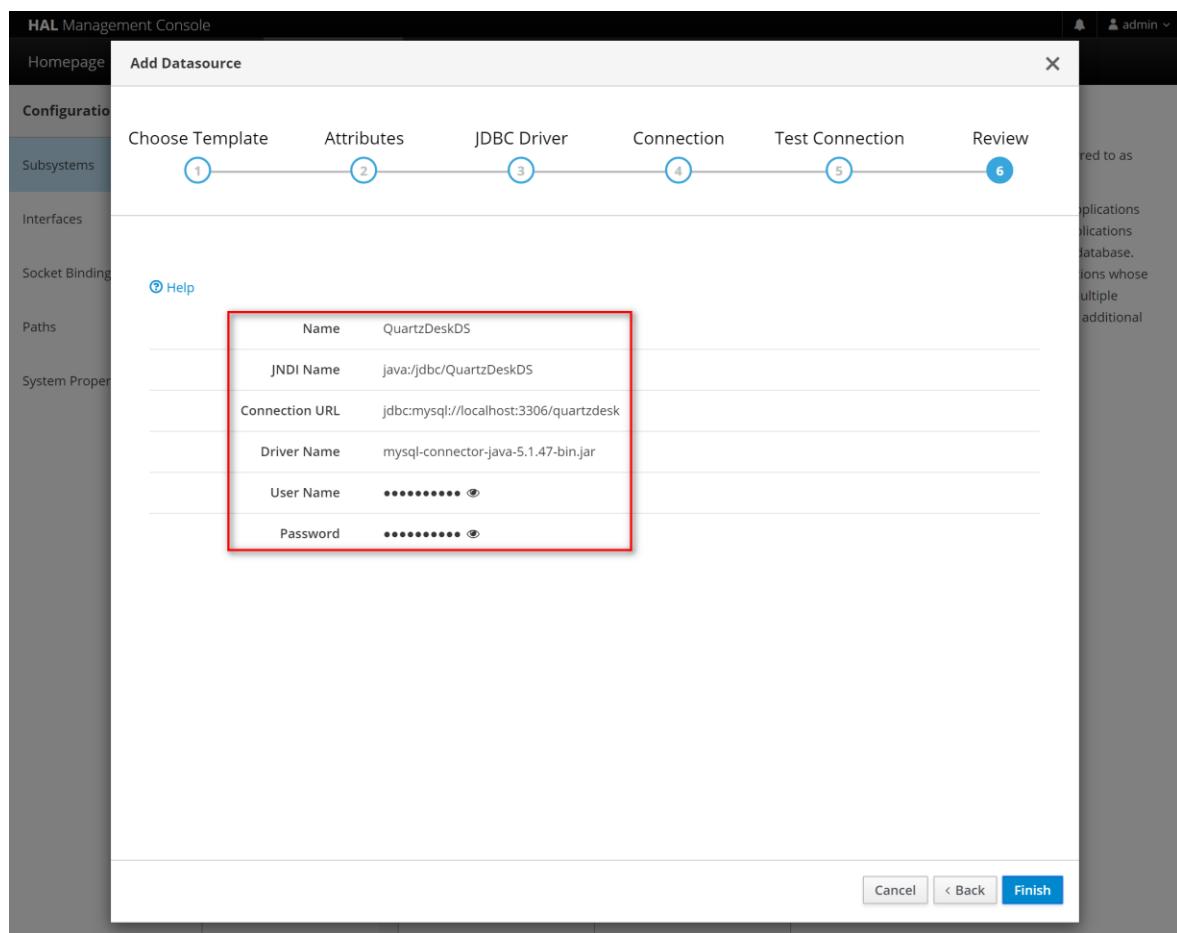

Click Next.

In Step 5, test the datasource by clicking on the Test Connection button.

Click Next.

In Step 6, review the datasource parameters.

Click Finish.

Select the registered QuartzDeskDS datasource, click View and modify the datasource configuration under the following tabs:

### Pool

Click the Edit button and enter the following values:

Initial Pool Size: 2

Min Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:

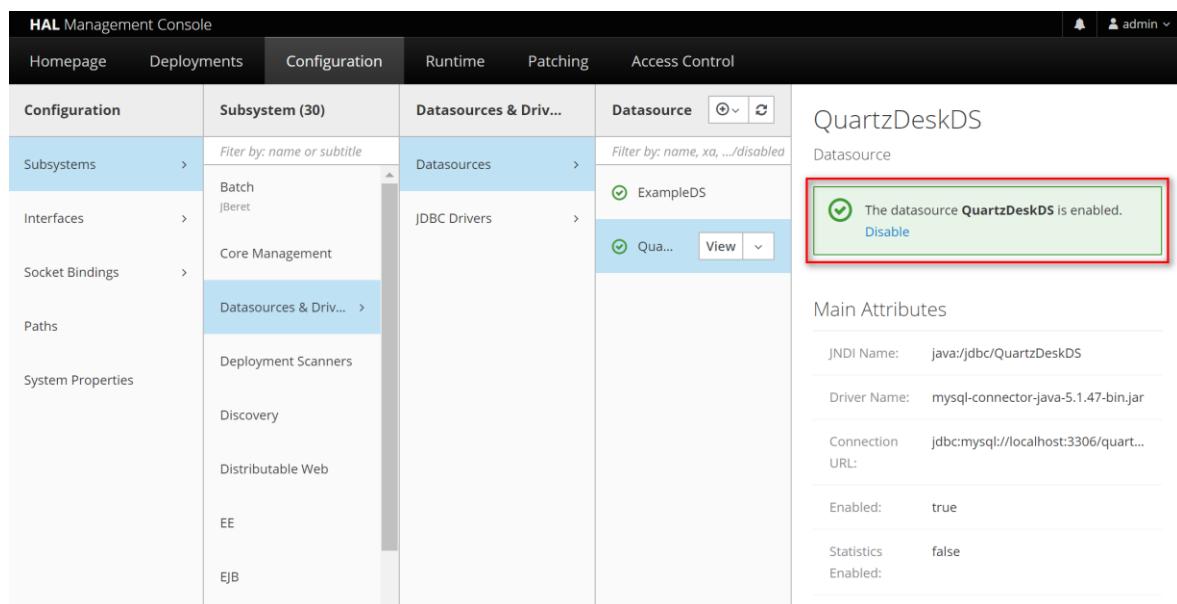

`org.jboss.jca.adapters.jdbc.extensions.mysql.MySQLValidConnectionChecker`

Exception Sorter Class Name:

`org.jboss.jca.adapters.jdbc.extensions.mysql.MySQLEceptionSorter`

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

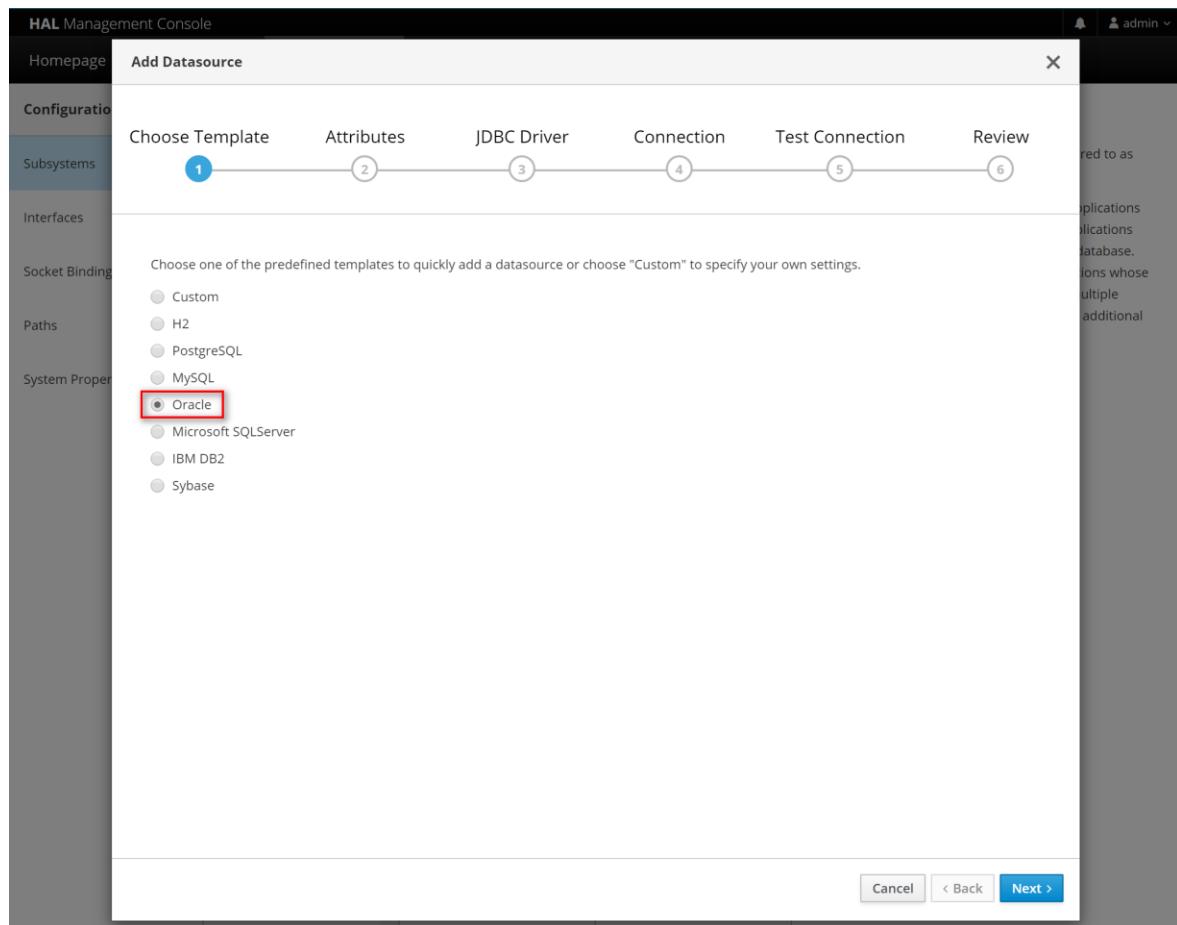

The screenshot shows the HAL Management Console interface. The left sidebar is under the 'Configuration' section, with 'Subsystems' expanded. Under 'Datasources & Driv...', the 'QuartzDeskDS' entry is selected and highlighted with a red box. To its right, the 'Main Attributes' panel displays the following information:

- JNDI Name: java:/jdbc/QuartzDeskDS
- Driver Name: mysql-connector-java-5.1.47-bin.jar
- Connection URL: jdbc:mysql://localhost:3306/quart...
- Enabled: true
- Statistics Enabled: false

#### 4.3.5 Oracle

In the Create Datasource dialog, select the Oracle option.

The screenshot shows the 'Add Datasource' dialog. The 'Choose Template' step is active, indicated by a blue circle. The 'Oracle' option is selected and highlighted with a red box. Other options listed include Custom, H2, PostgreSQL, MySQL, Microsoft SQLServer, IBM DB2, and Sybase. The right side of the dialog shows a preview of the connection details, which are mostly obscured by a gray overlay.

Click Next.

In Step 2, enter the following datasource attributes:

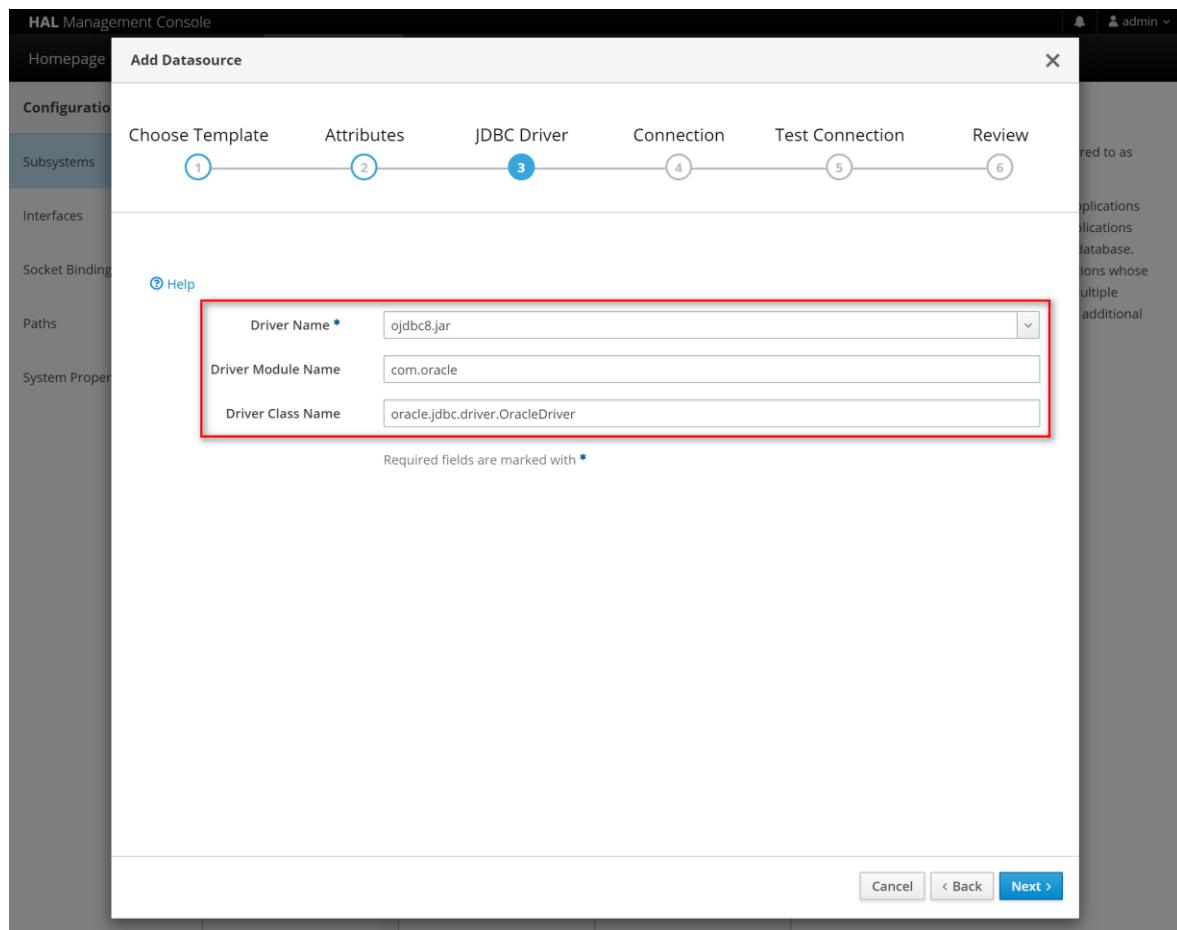

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed Oracle JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: com.oracle

Driver Class Name: oracle.jdbc.driver.OracleDriver

The screenshot shows the 'Add Datasource' wizard in the HAL Management Console. The steps are numbered 1 through 6: Choose Template, Attributes, JDBC Driver, Connection, Test Connection, and Review. Step 3, 'JDBC Driver', is active. A red box highlights the 'Driver Name' input field, which contains 'ojdbc8.jar'. Below it are fields for 'Driver Module Name' (com.oracle) and 'Driver Class Name' (oracle.jdbc.driver.OracleDriver). A note at the bottom says 'Required fields are marked with \*'. At the bottom right are 'Cancel', '< Back', and 'Next >' buttons.

Click Next.

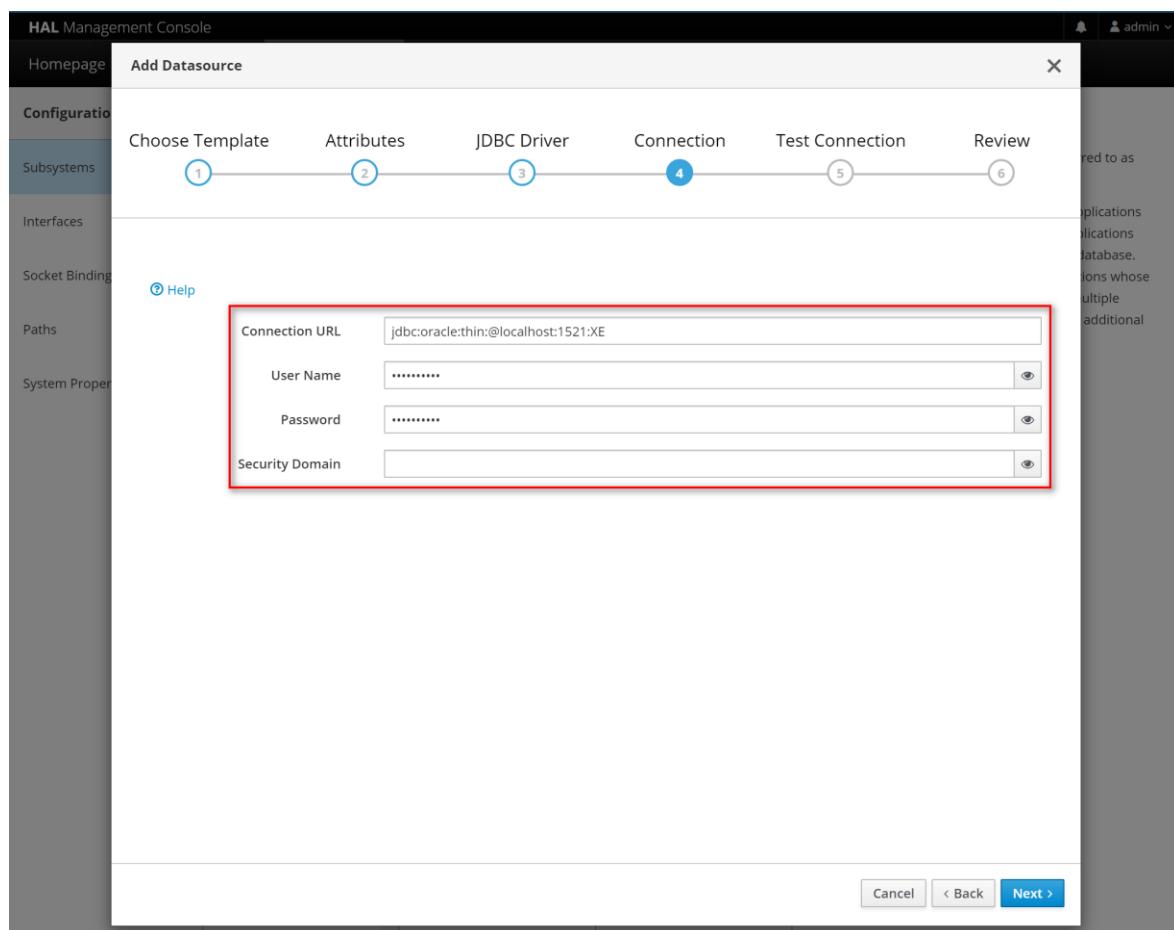

In Step 4, enter the following values:

Connection URL: jdbc:oracle:thin:@DB\_HOST:DB\_PORT:ORACLE\_SERVICE\_NAME

Username: DB\_USER

Password: DB\_PASSWORD

Security Domain: leave empty

Click Next.

Select the registered QuartzDeskDS datasource and modify the datasource configuration under the following tabs:

### Pool

Click the Edit button and enter the following values:

Min Pool Size: 2

Initial Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:

org.jboss.jca.adapters.jdbc.extensions.oracle.OracleValidConnectionChecker

Stale Connection Checker Class Name:

org.jboss.jca.adapters.jdbc.extensions.oracle.OracleStaleConnectionChecker

Exception Sorter Class Name:

org.jboss.jca.adapters.jdbc.extensions.oracle.OracleExceptionSorter

Click Save.

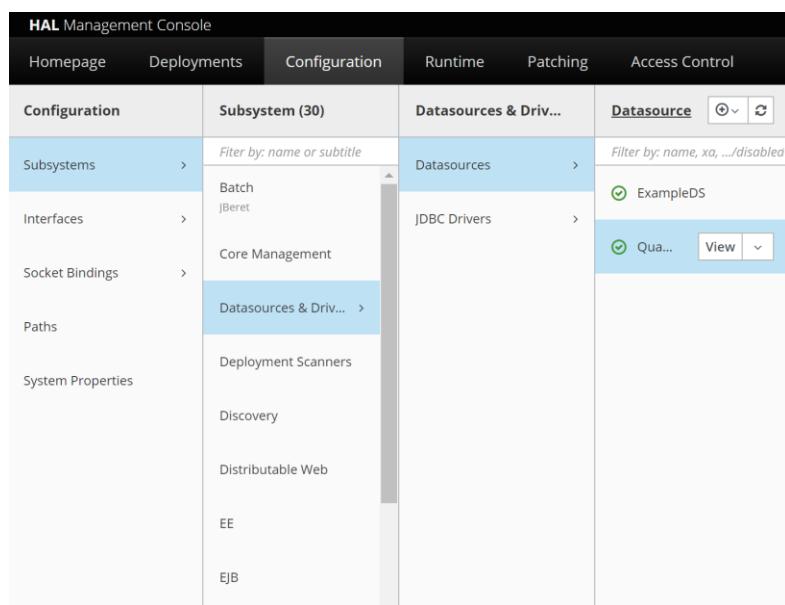

### Statements

Click the Edit button and enter the following values:

Statement Cache Size: 100

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

The screenshot shows the HAL Management Console interface. The top navigation bar includes links for Homepage, Deployments, Configuration (which is selected), Runtime, Patching, and Access Control. The Configuration section on the left has several categories: Subsystems, Interfaces, Socket Bindings, Paths, and System Properties. Under Subsystems, 'Batch' and 'JBoss' are listed. Under Paths, 'Core Management' and 'Datasources & Driv...' are listed. Under System Properties, 'Deployment Scanners', 'Discovery', 'Distributable Web', 'EE', and 'EJB' are listed. On the right, under the 'Datasources & Driv...' tab, there is a list of datasources: 'ExampleDS' (selected) and 'QuartzDeskDS'. A red box highlights the 'QuartzDeskDS' entry, which has a green checkmark indicating it is enabled. Below this, a section titled 'Main Attributes' lists various properties: JNDI Name: java:/jdbc/QuartzDeskDS, Driver Name: ojdbc8.jar, Connection URL: jdbc:oracle:thin:@localhost:1521:..., Enabled: true, Statistics: false, and Enabled: false (this last entry appears to be a duplicate). There are also decorative vertical bars on the right side of the page.

QuartzDeskDS

 The datasource **QuartzDeskDS** is enabled.  
[Disable](#)

Main Attributes

JNDI Name: java:/jdbc/QuartzDeskDS

Driver Name: ojdbc8.jar

Connection URL: jdbc:oracle:thin:@localhost:1521:...

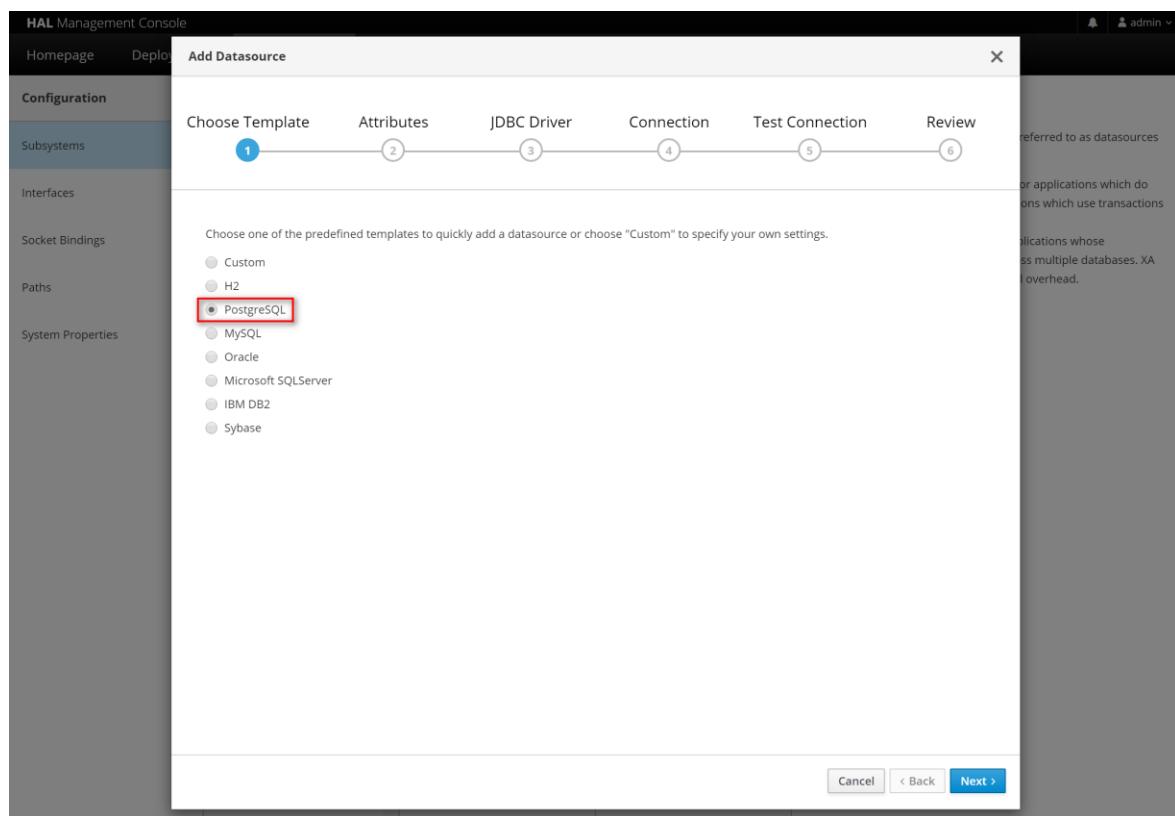

Enabled: true

Statistics: false

Enabled: false

### 4.3.6 PostgreSQL

In the Create Datasource dialog, select the PostgreSQL option.

Click Next.

In Step 2, enter the following datasource attributes:

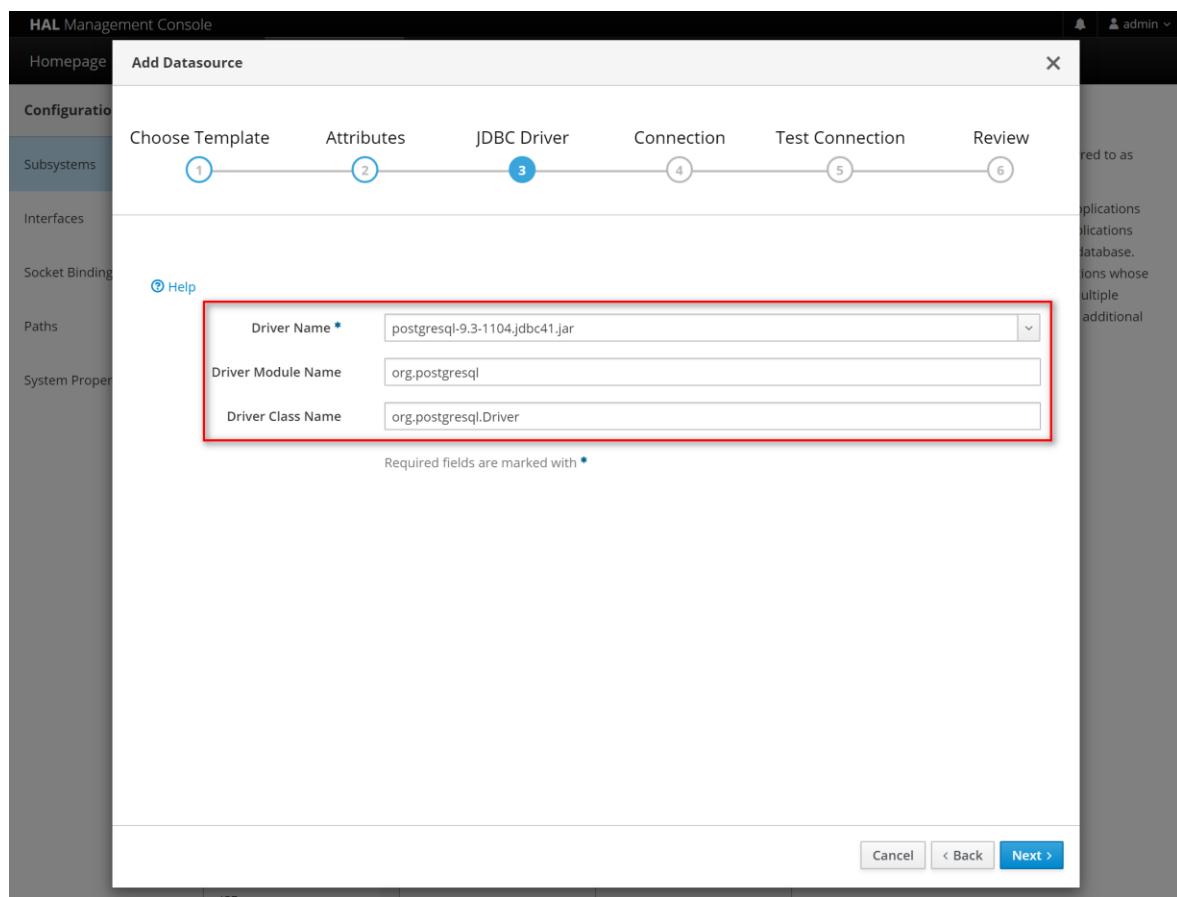

Name: QuartzDeskDS

JNDI Name: java:/jdbc/QuartzDeskDS

In Step 3, select the installed PostgreSQL JDBC driver JAR in the Driver Name field and enter the following values:

Driver Module Name: org.postgresql

Driver Class Name: org.postgresql.Driver

Click Next.

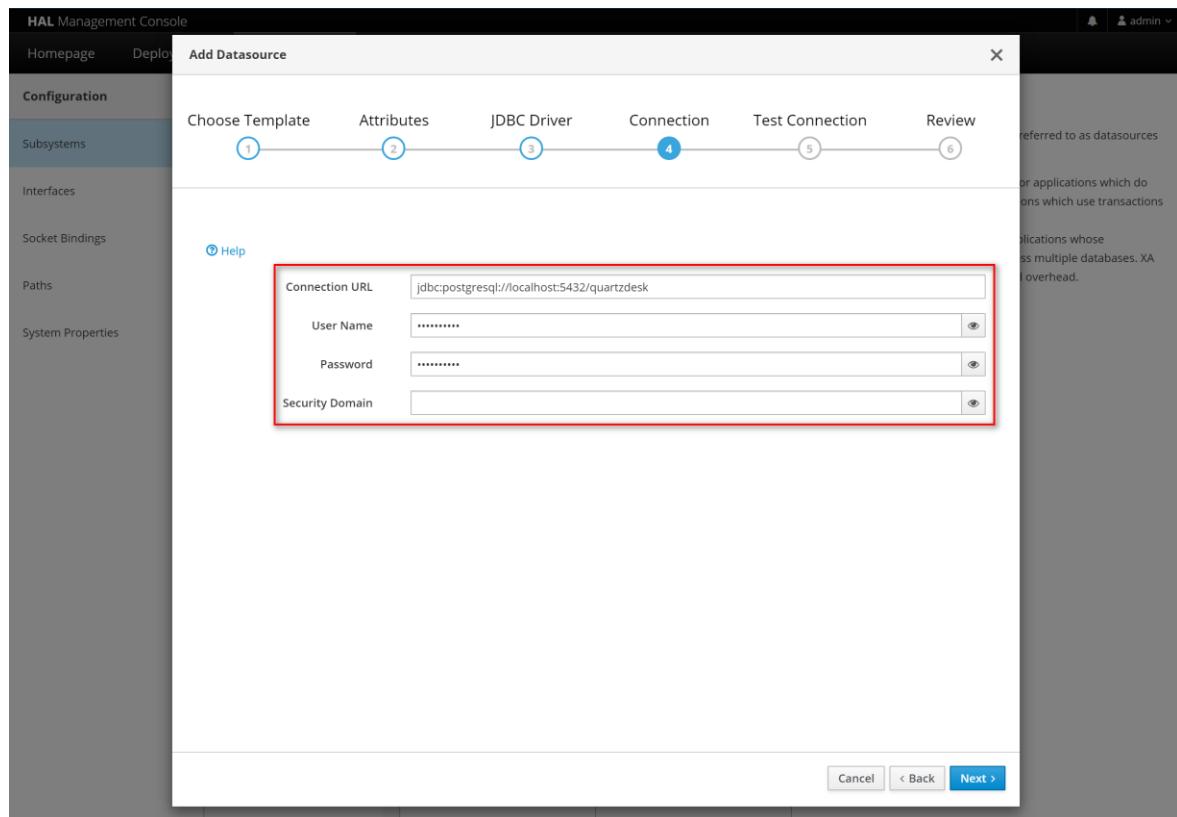

In Step 4, enter the following values:

Connection URL: `jdbc:postgresql://DB_HOST:DB_PORT/DB_NAME`

User Name: `DB_USER`

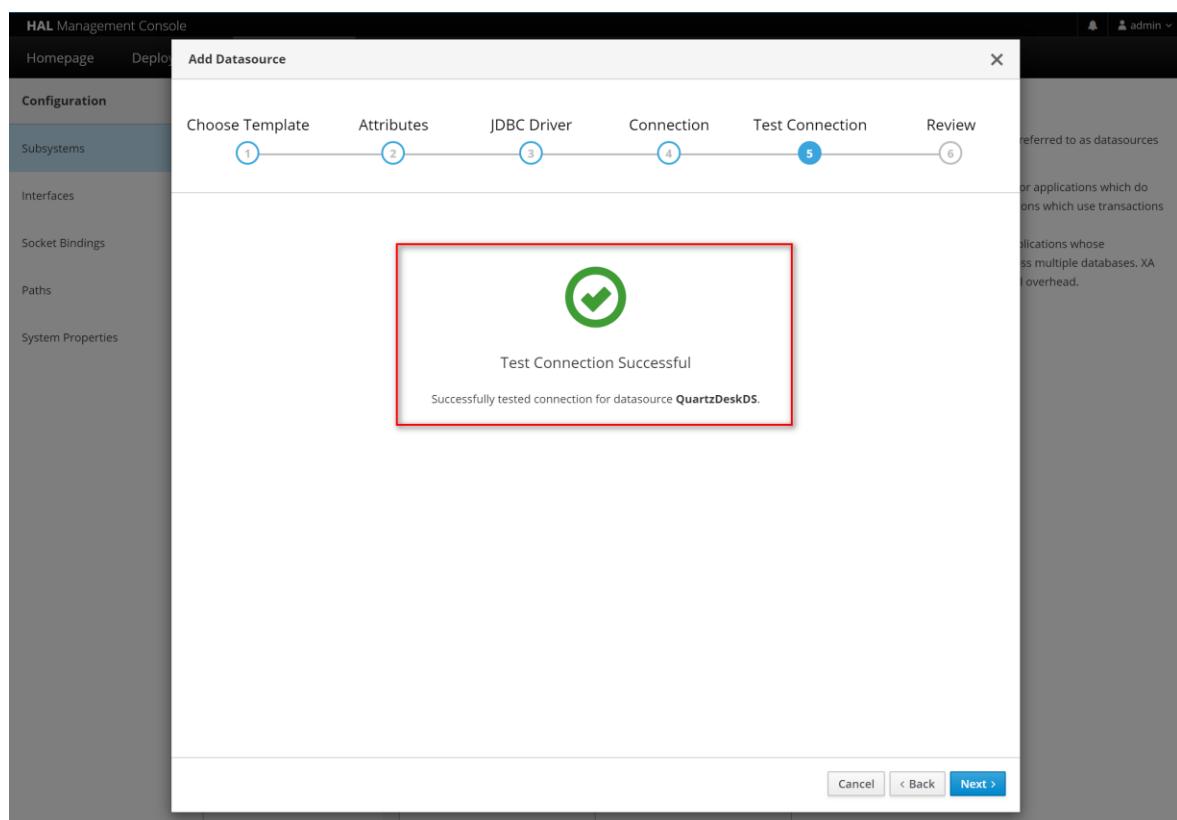

Password: `DB_PASSWORD`

Security Domain: leave empty

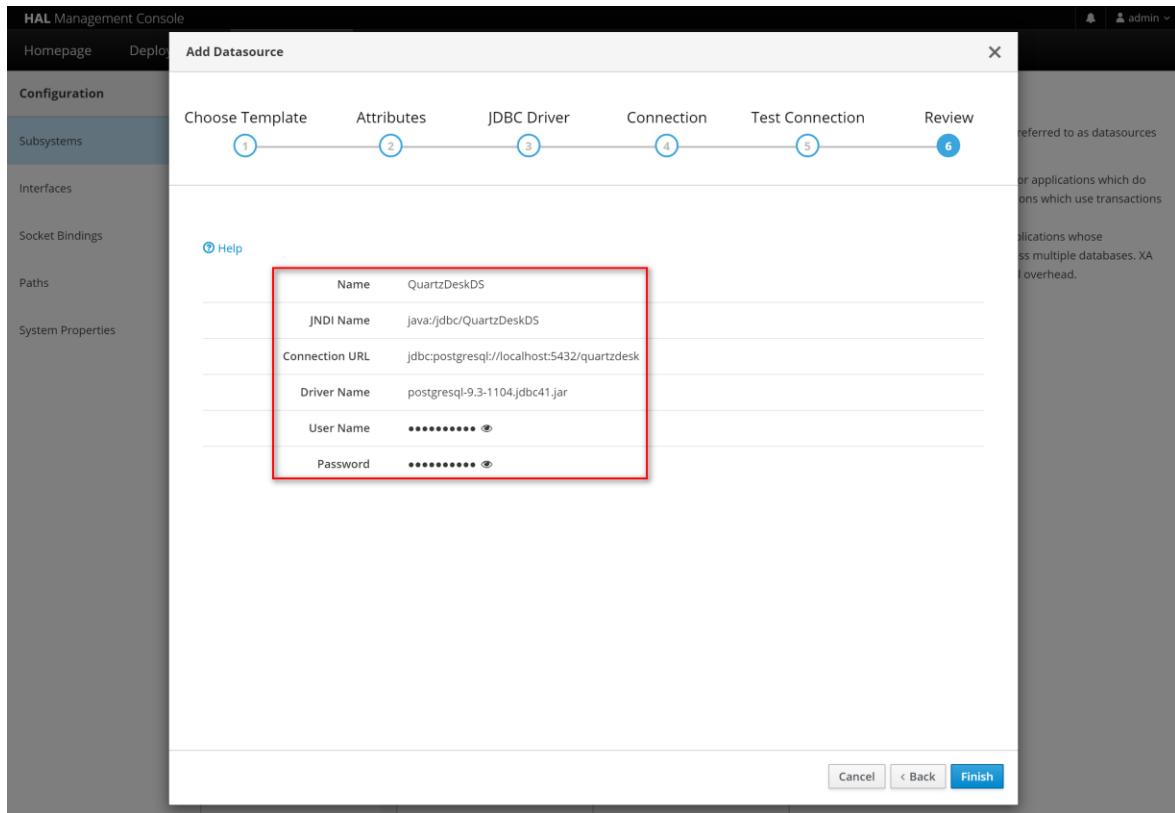

Click Next.

In Step 5, test the datasource by clicking on the Test Connection button.

Click Next.

In Step 6, review the datasource parameters.

Click Finish.

Select the registered QuartzDeskDS datasource, click View and modify the datasource configuration under the following tabs:

### Connection

Add the following property:

applicationName=QuartzDesk Web Application

Click Save.

### Pool

Click the Edit button and enter the following values:

Initial Pool Size: 2

Min Pool Size: 2

Max Pool Size: 10

Pool Prefill: On

Click Save.

### Validation

Click the Edit button and enter the following values:

Valid Connection Checker Class Name:

org.jboss.jca.adapters.jdbc.extensions.postgres.PostgreSQLValidConnectionChecker

Exception Sorter Class Name:

org.jboss.jca.adapters.jdbc.extensions.postgres.PostgreSQLExceptionSorter

Click Save.

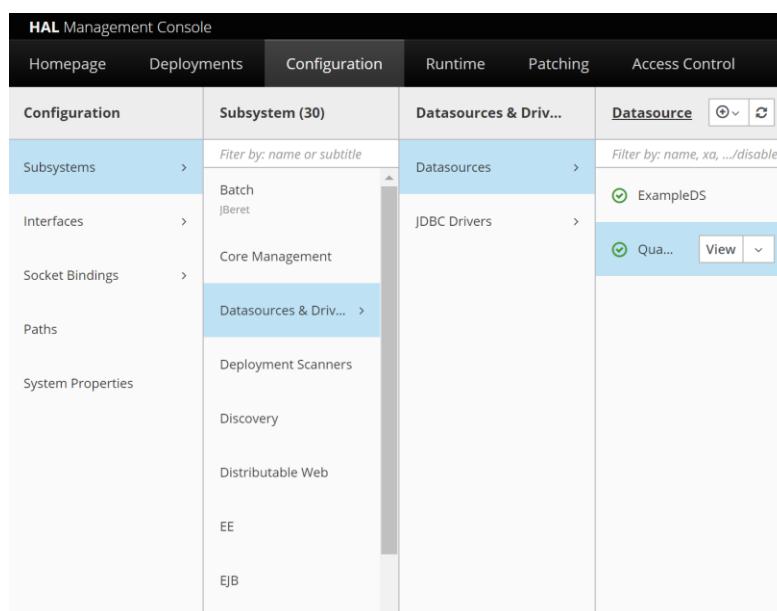

### Statements / Tracking

Click the Edit button and enter the following values:

Prepared Statements Cache Size: 100

Click Save.

Select the QuartzDeskDS datasource in the list of available datasources and make sure it is enabled.

The screenshot shows the HAL Management Console interface. The top navigation bar includes 'HAL Management Console', a bell icon, and 'admin'. Below the navigation bar, there are tabs: 'Homepage', 'Deployments', 'Configuration', 'Runtime', 'Patching', and 'Access Control'. The 'Configuration' tab is active. Under 'Configuration', there are several sections: 'Subsystems' (Batch, JBeret), 'Interfaces' (Core Management), 'Socket Bindings' (Datasources & Driv...), 'Paths' (Deployment Scanners, Discovery, Distributable Web, EE, EJB), and 'System Properties'. On the right side, under 'Datasources & Driv...', the 'Datasource' tab is selected. It lists 'ExampleDS' and 'QuartzDeskDS'. A red box highlights the 'QuartzDeskDS' entry, which has a green checkmark and the message 'The datasource **QuartzDeskDS** is enabled.' Below this, there is a section titled 'Main Attributes' with the following details:

|                     |                                      |
|---------------------|--------------------------------------|
| JNDI Name:          | java:/jdbc/QuartzDeskDS              |
| Driver Name:        | postgresql-9.3-1104.jdbc41.jar       |
| Connection URL:     | jdbc:postgresql://localhost:5432/... |
| Enabled:            | true                                 |
| Statistics Enabled: | false                                |

## 4.4 Application Work Directory

Create a QuartzDesk Web Application work directory (WORK\_DIR) anywhere on the local file system. The directory must be readable and writeable by the user the WFAS process runs under.

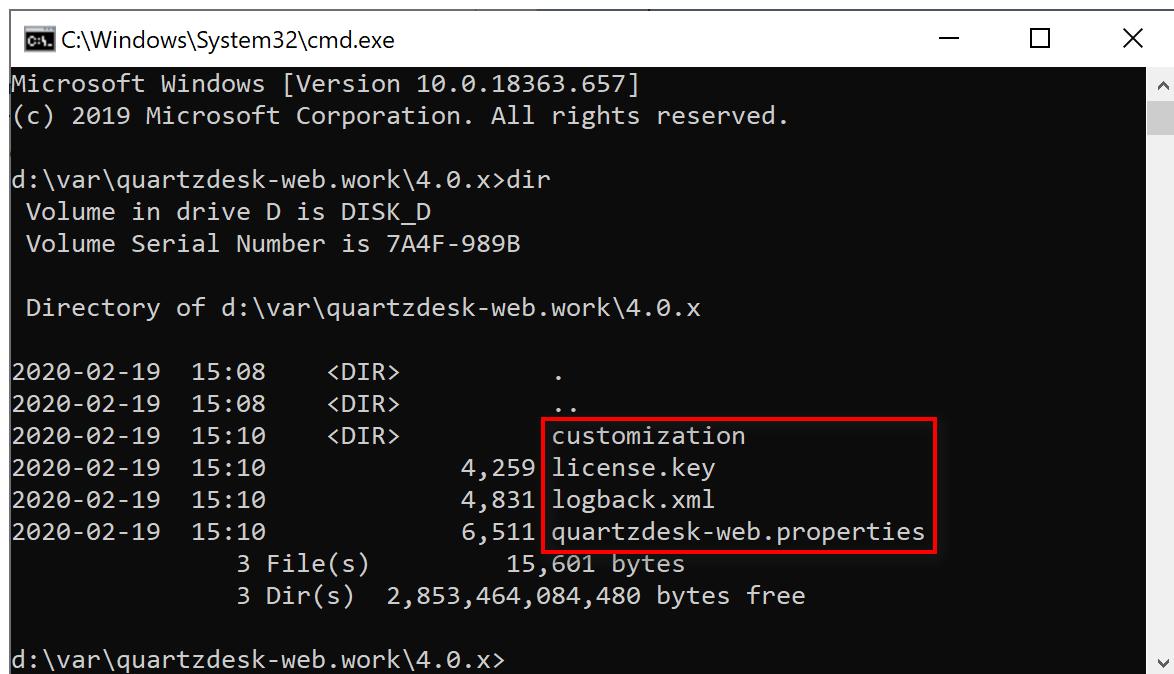

Copy your QuartzDesk license key file (`license.key`) to WORK\_DIR.

 You can obtain a free 30-day trial license key at [www.quartzdesk.com](http://www.quartzdesk.com) (go to Try / Purchase > Get Trial License Key).

Open the QuartzDesk Web Application archive (`quartzdesk-web-x.y.z.war`) and copy all files from the `extras/work` directory into WORK\_DIR.

 If you cannot open the WAR file directly, rename it to \*.zip. Do not forget to rename the file back to \*.war once you have extracted the required files.

In the following figure you can see an example of a QuartzDesk Web Application work directory correctly set up on a Microsoft Windows machine.

```
C:\Windows\System32\cmd.exe
Microsoft Windows [Version 10.0.18363.657]
(c) 2019 Microsoft Corporation. All rights reserved.

d:\var\quartzdesk-web.work\4.0.x>dir
Volume in drive D is DISK_D
Volume Serial Number is 7A4F-989B

Directory of d:\var\quartzdesk-web.work\4.0.x

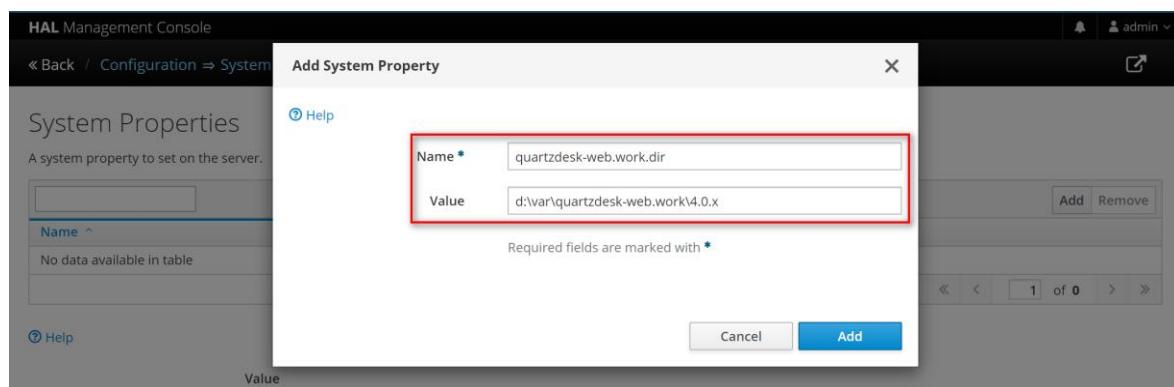

2020-02-19  15:08    <DIR>          .
2020-02-19  15:08    <DIR>          ..
2020-02-19  15:10    <DIR>          customization
2020-02-19  15:10                4,259 license.key
2020-02-19  15:10                4,831 logback.xml
2020-02-19  15:10                6,511 quartzdesk-web.properties
                           3 File(s)      15,601 bytes
                           3 Dir(s)   2,853,464,084,480 bytes free

d:\var\quartzdesk-web.work\4.0.x>
```

In WFAC go to Configuration → System Properties → View. Click the Add button to add a new boot-time system property:

Name: quartzdesk-web.work.dir

Value: WORK\_DIR

Click Add.

Restart WFAS for the changes to take effect.

## 4.5 Application Configuration

Open the QuartzDesk Web Application configuration file `WORK_DIR/quartzdesk-web.properties`.

Based on the type and version of the database created in 4.1, change the value of the `db.profile` configuration property according to the following table.

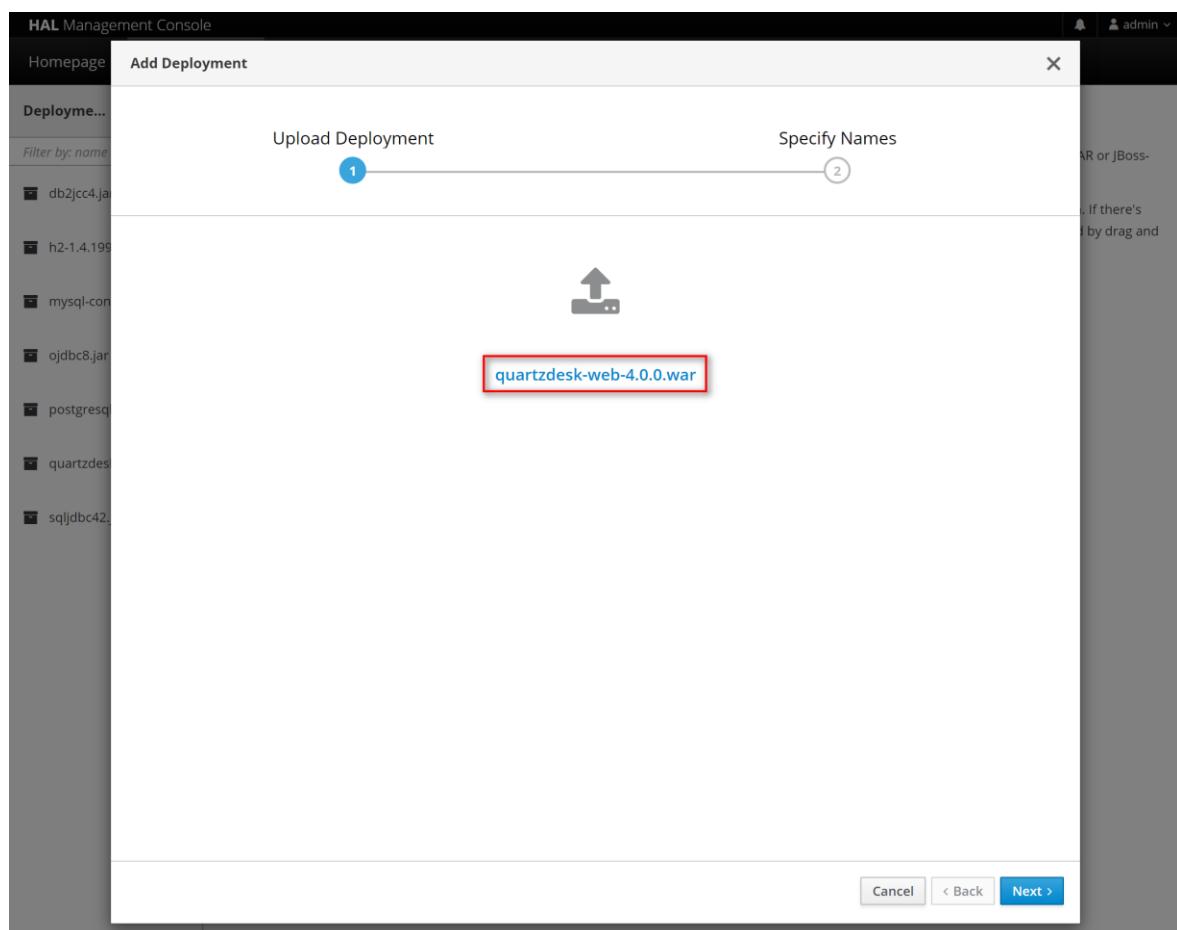

| Database             | Database Version | db.profile Value |
|----------------------|------------------|------------------|
| DB2                  | >= 10.0          | db2              |
| H2                   | >= 1.3.170       | h2               |
| Microsoft SQL Server | >= 2008          | mssql            |
| MySQL (MyISAM)       | >= 5.6           | mysql            |
| MySQL (InnoDB)       | >= 5.6           | mysql_innodb     |
| Oracle               | == 8i            | oracle8          |
| Oracle               | >= 9i            | oracle9          |
| PostgreSQL           | == 8.1           | postgres81       |
| PostgreSQL           | >= 8.2           | postgres82       |

Optionally, you can adjust the QuartzDesk Web Application logging parameters by editing the WORK\_DIR/logback.xml configuration file. The default sample logback.xml configuration file makes QuartzDesk Web Application log under the WORK\_DIR/logs directory that is automatically created when the web application starts. Please refer to the [Logback Manual](#) for Logback configuration details.

## 4.6 Deploy Application

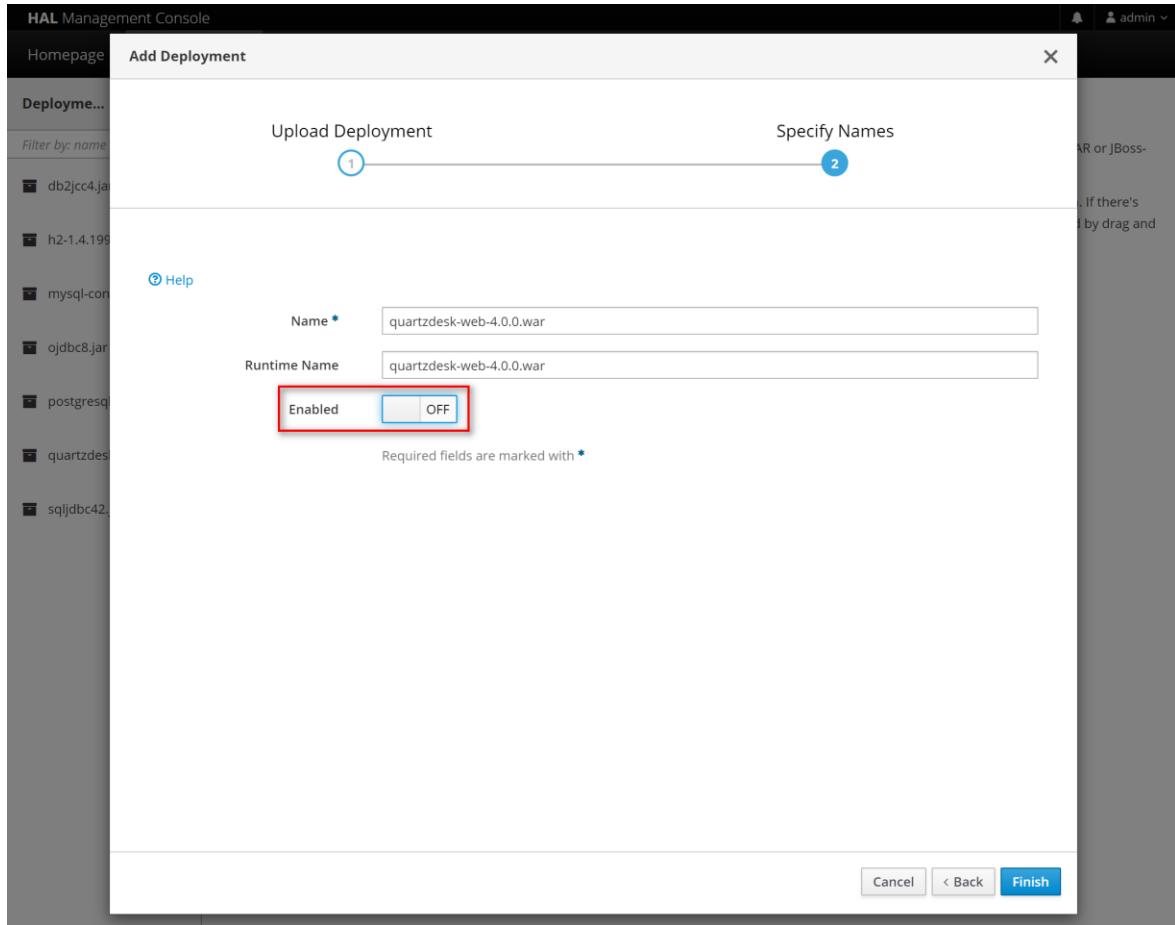

In WFAC go to Deployments, click the Add button and select Upload Deployment.

In Step 1, select the QuartzDesk Web Application WAR file to deploy.

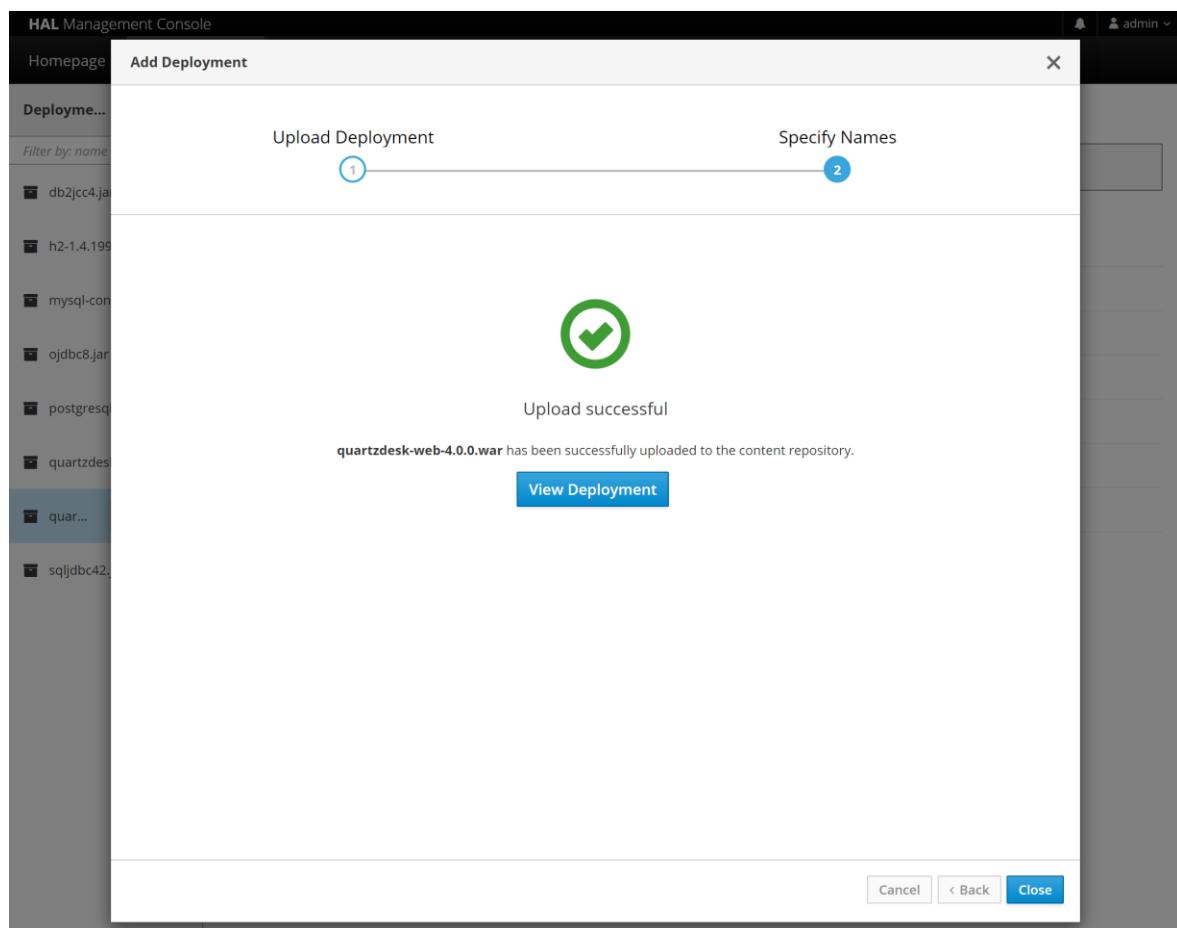

Click Next.

In Step 2, set Enabled to OFF.

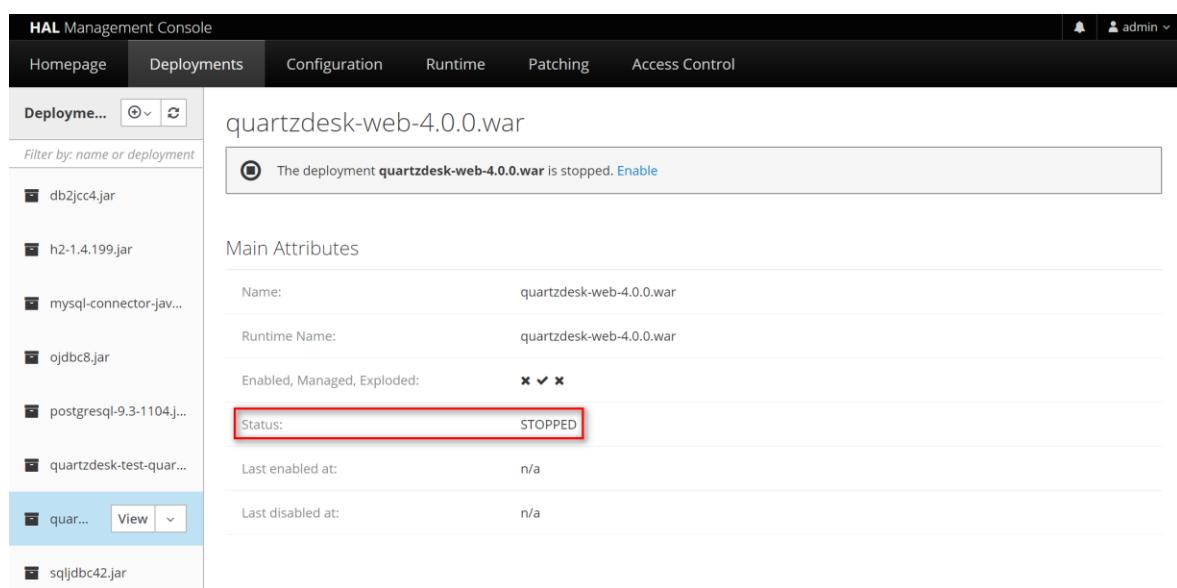

Click Finish and wait for the deployment to complete.

Click Close.

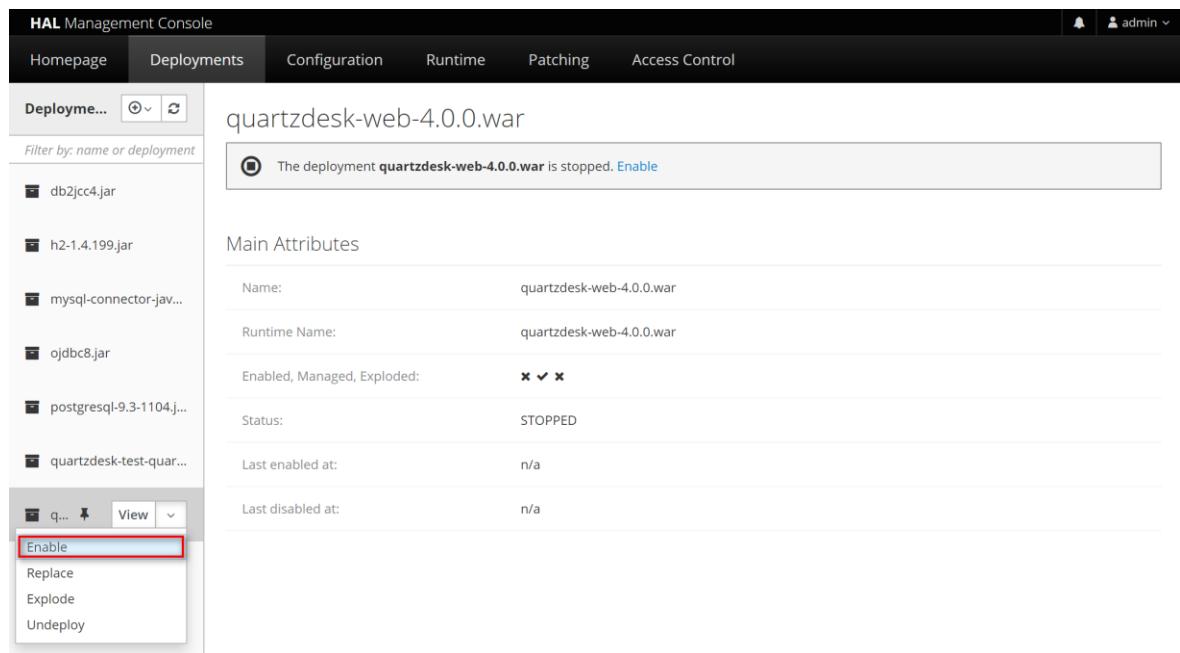

Deployed quartzdesk-web-x.y.z.war file should appear in the list of deployments. Its status should be STOPPED.

| Name                     | Status  |
|--------------------------|---------|
| quartzdesk-web-4.0.0.war | STOPPED |

## 4.7 Start Application

In WFAC go to Deployments, select QuartzDesk Web Application, open the local menu next to it and select Enable to start the application.

The screenshot shows the HAL Management Console interface. The top navigation bar includes 'Homepage', 'Deployments' (which is selected), 'Configuration', 'Runtime', 'Patching', and 'Access Control'. Below the navigation is a search bar with placeholder text 'Filter by: name or deployment' and a dropdown menu with options 'Deploy...', 'View', and a context menu. The context menu has items 'Enable' (highlighted with a red box), 'Replace', 'Explode', and 'Undeploy'. The main content area displays a deployment named 'quartzdesk-web-4.0.0.war'. A message box indicates that the deployment is stopped and provides a link to 'Enable'. Below this, the 'Main Attributes' section lists the following properties:

|                             |   |
|-----------------------------|---|
| Name:                       | quartzdesk-web-4.0.0.war  |
| Runtime Name:               | quartzdesk-web-4.0.0.war  |
| Enabled, Managed, Exploded: | <input checked="" type="checkbox"/> <input checked="" type="checkbox"/> <input checked="" type="checkbox"/> |
| Status:                     | STOPPED   |
| Last enabled at:            | n/a   |
| Last disabled at:           | n/a   |

The application should be starting now.

Monitor the WFAS server.log log file under  
WFAS\_INSTALL\_ROOT/WFAS\_CONFIG/logs for errors and wait for the application start operation to complete.

You can safely ignore the following warning messages:

```
02:07:20,714 WARN [org.jboss.as.server.deployment] (MSC service thread 1-8) WFLYSRV0059: Class Path entry foo.jar in /d:/Java/wildfly-18.0.1.Final/bin/content/quartzdesk-web-x.y.z.war/WEB-INF/lib/bar.jar does not point to a valid jar for a Class-Path reference.
```

Upon successful starting, the QuartzDesk Web Application's status changes to OK.

HAL Management Console

quartzdesk-web-4.0.0.war

The deployment **quartzdesk-web-4.0.0.war** is enabled and active. [Disable](#)

Main Attributes

|                             |                          |
|-----------------------------|--------------------------|
| Name:                       | quartzdesk-web-4.0.0.war |
| Runtime Name:               | quartzdesk-web-4.0.0.war |
| Context Root:               | /quartzdesk              |
| Enabled, Managed, Exploded: | ✓ ✓ ✕                    |
| Status:                     | OK                       |
| Last enabled at:            | 3/3/20, 10:00 PM         |
| Last disabled at:           | n/a                      |

Check the QuartzDesk Web Application logs (by default located in the `WORK_DIR/logs` directory) for errors.

If there are no errors, point your browser to

[http://WFAS\\_HTTP\\_HOST:WFAS\\_HTTP\\_PORT/quartzdesk/](http://WFAS_HTTP_HOST:WFAS_HTTP_PORT/quartzdesk/) and verify that the QuartzDesk Web Application's GUI is accessible.

Check the version number of the deployed QuartzDesk Web Application.

To log in, use the default administrator login credentials:

Username: admin

Password: admin123

Once logged in, you can go to Settings > Users to manage users with access to the QuartzDesk Web Application's GUI. Users can be assigned different access permissions based on their intended roles.

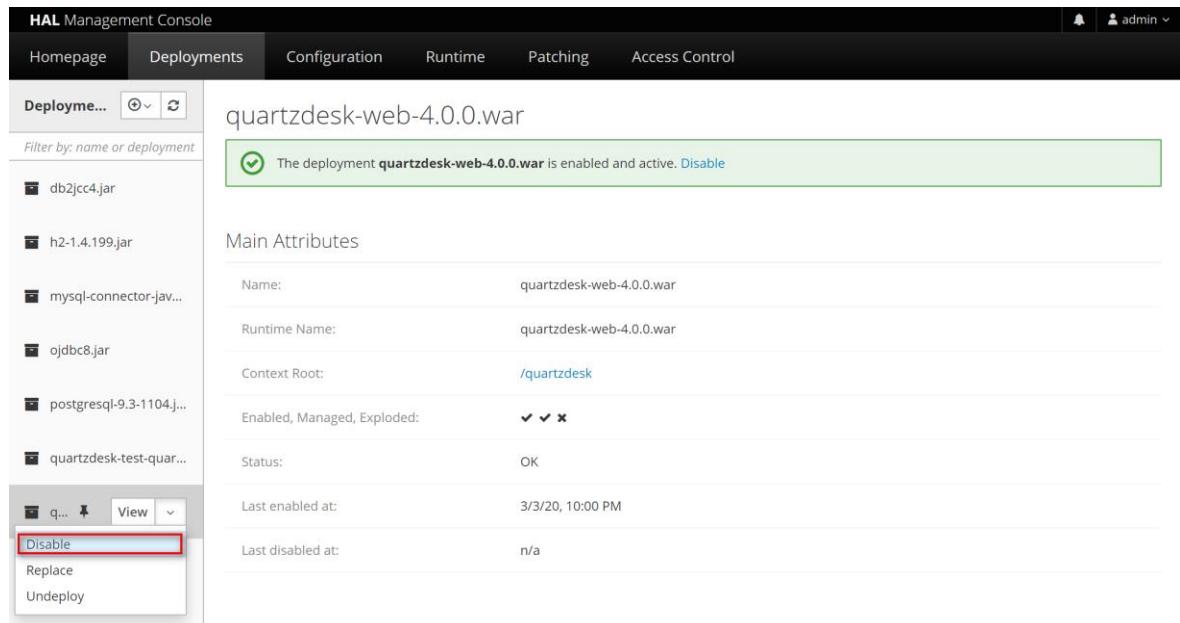

In Settings > Groups, you can manage groups and assign access permissions to these groups. A group can contain users (members) who inherit access permissions of the group. A user can be a member of any number of groups.

Effective access permissions of a user are permissions associated directly with the user plus access permissions of all groups the user is a member of.

## 5. Upgrading

### 5.1 Stop Existing Application

In WFAC go to Deployments, select QuartzDesk Web Application, open the local menu next to it and select Disable to stop the application.

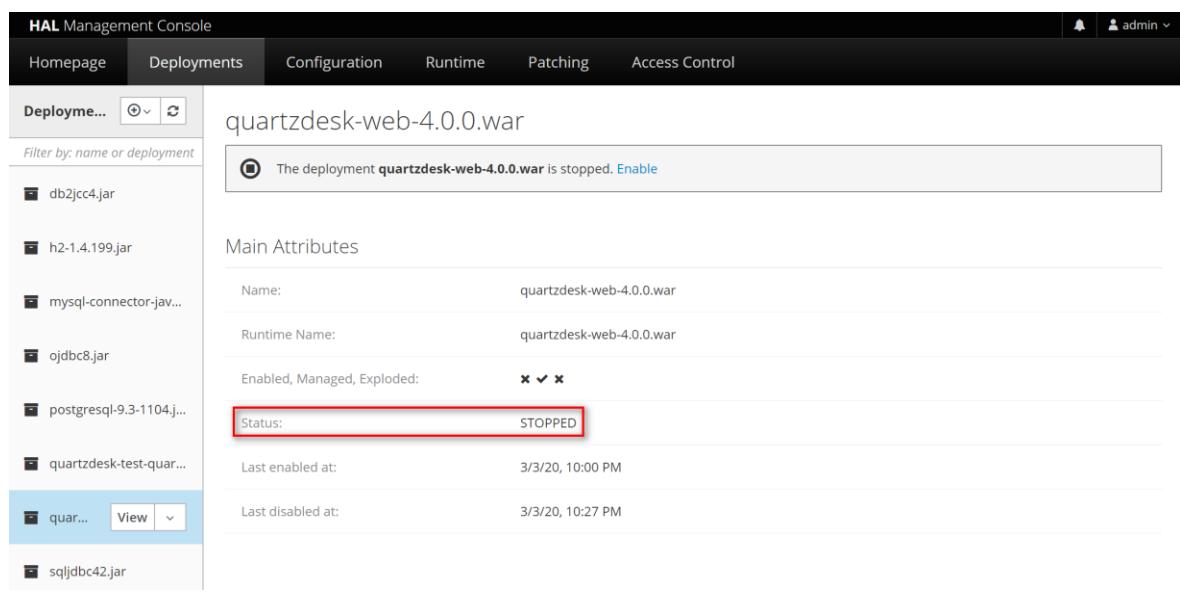

The screenshot shows the HAL Management Console interface. The top navigation bar includes 'Homepage', 'Deployments' (which is selected), 'Configuration', 'Runtime', 'Patching', and 'Access Control'. The user is logged in as 'admin'. In the main content area, under 'Deployments', the deployment 'quartzdesk-web-4.0.0.war' is listed. A context menu is open next to this deployment, with the 'Disable' option highlighted by a red box. Other options in the menu include 'Replace' and 'Undeploy'. Below the deployment list, a message states: 'The deployment quartzdesk-web-4.0.0.war is enabled and active. Disable'. The 'Main Attributes' section displays the following information:

|                             |                          |
|-----------------------------|--------------------------|
| Name:                       | quartzdesk-web-4.0.0.war |
| Runtime Name:               | quartzdesk-web-4.0.0.war |
| Context Root:               | /quartzdesk              |
| Enabled, Managed, Exploded: | ✓ ✓ ✘                    |
| Status:                     | OK                       |
| Last enabled at:            | 3/3/20, 10:00 PM         |
| Last disabled at:           | n/a                      |

The application should be stopping now.

Monitor the WFAS server.log log file under  
WFAS\_INSTALL\_ROOT/WFAS\_CONFIG/logs for errors and wait for the application stop operation to complete.

Upon successful stopping, the QuartzDesk Web Application's status changes to STOPPED.

This screenshot shows the HAL Management Console after the application has been stopped. The deployment 'quartzdesk-web-4.0.0.war' is listed in the 'Deployments' tab. The context menu is no longer open. A message above the deployment indicates: 'The deployment quartzdesk-web-4.0.0.war is stopped. Enable'. The 'Main Attributes' section now shows the 'Status' as 'STOPPED' (highlighted with a red box). The other attributes remain the same as in the previous screenshot.

|                             |                          |
|-----------------------------|--------------------------|
| Name:                       | quartzdesk-web-4.0.0.war |
| Runtime Name:               | quartzdesk-web-4.0.0.war |
| Enabled, Managed, Exploded: | ✗ ✗ ✘                    |
| Status:                     | STOPPED                  |
| Last enabled at:            | 3/3/20, 10:00 PM         |
| Last disabled at:           | 3/3/20, 10:27 PM         |

## 5.2 Backup

Backup the QuartzDesk Web Application database. We recommend performing a **full database backup**.

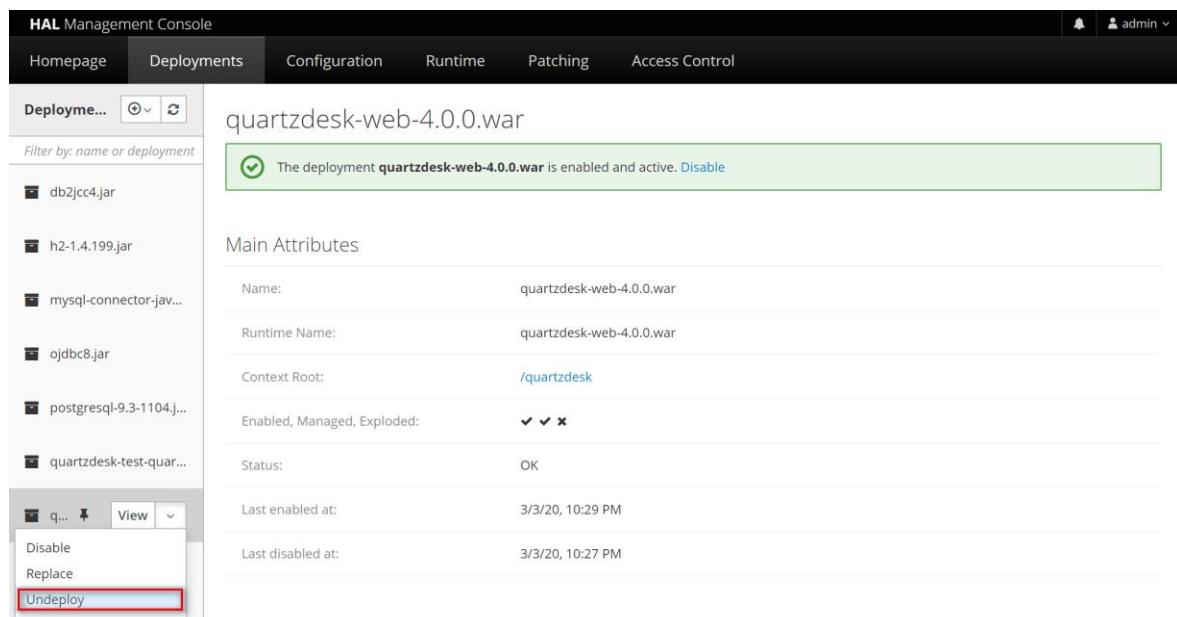

Backup the contents of the QuartzDesk Web Application work directory.

Make sure you have the WAR file of the existing QuartzDesk Web Application.

Store the backup files in a safe place so you can restore the existing QuartzDesk Web Application version if the need arises.

## 5.3 Remove Existing Application

In WFAC go to Deployments, select the deployed QuartzDesk Web Application, open the local menu next to it and select Undeploy to remove the application.

The screenshot shows the HAL Management Console interface. The top navigation bar includes 'Homepage', 'Deployments' (which is selected), 'Configuration', 'Runtime', 'Patching', and 'Access Control'. On the left, there's a sidebar with deployment-related links like 'Deployments...', 'Filter by: name or deployment', and several JAR files listed: db2jcc4.jar, h2-1.4.199.jar, mysql-connector-jav..., ojdbc8.jar, postgresql-9.3-1104.j..., and quartzdesk-test-quar...'. The main content area displays the deployment 'quartzdesk-web-4.0.0.war'. A green box indicates it is enabled and active. Below this, the 'Main Attributes' section lists various properties: Name (quartzdesk-web-4.0.0.war), Runtime Name (quartzdesk-web-4.0.0.war), Context Root (/quartzdesk), Enabled, Managed, Exploded (✓ ✓ ✘), Status (OK), Last enabled at (3/3/20, 10:29 PM), and Last disabled at (3/3/20, 10:27 PM). A local menu on the right side of the deployment entry offers 'Disable', 'Replace', and 'Undeploy', with 'Undeploy' being the selected option and highlighted with a red border.

Upon successful removal, QuartzDesk Web Application disappears from the Deployment list.

## 5.4 Deploy New Application

Deploy the new version of the QuartzDesk Web Application by following the deployment steps outlined in 4.6.

Some WFAS releases contain a bug that prevents the application server from invalidating and recompiling the JSP cache of redeployed web applications. Therefore, we recommend that you stop the WFAS instance and manually purge the QuartzDesk Web Application JSP cache located at `WFAS_INSTALL_ROOT/WFAS_CONFIG/tmp/quartzdesk-web-x.y.z`. Once the cache has been purged, start the WFAS instance.

## 5.5 Start New Application

Start the new version of QuartzDesk Web Application by following the steps outlined in 4.7.

## 6. QuartzDesk 2.x to 3.x Migration Notes

To upgrade QuartzDesk Web Application 2.x to 3.x, follow the upgrade steps outlined in 5.

Before deploying the new QuartzDesk Web Application WAR file (quartzdesk-web-x.y.z.war), as outlined in 5.4, make sure you have implemented changes described in this chapter.

### 6.1 Minimum Required Java Version

QuartzDesk Web Application 3.x requires Java 7 or higher. Make sure WFAS is configured to use Java 7 or higher.

### 6.2 Rename Configuration File

The name of the QuartzDesk Web Application 3.x configuration file has changed from `quartzdesk.properties` to `quartzdesk-web.properties`.

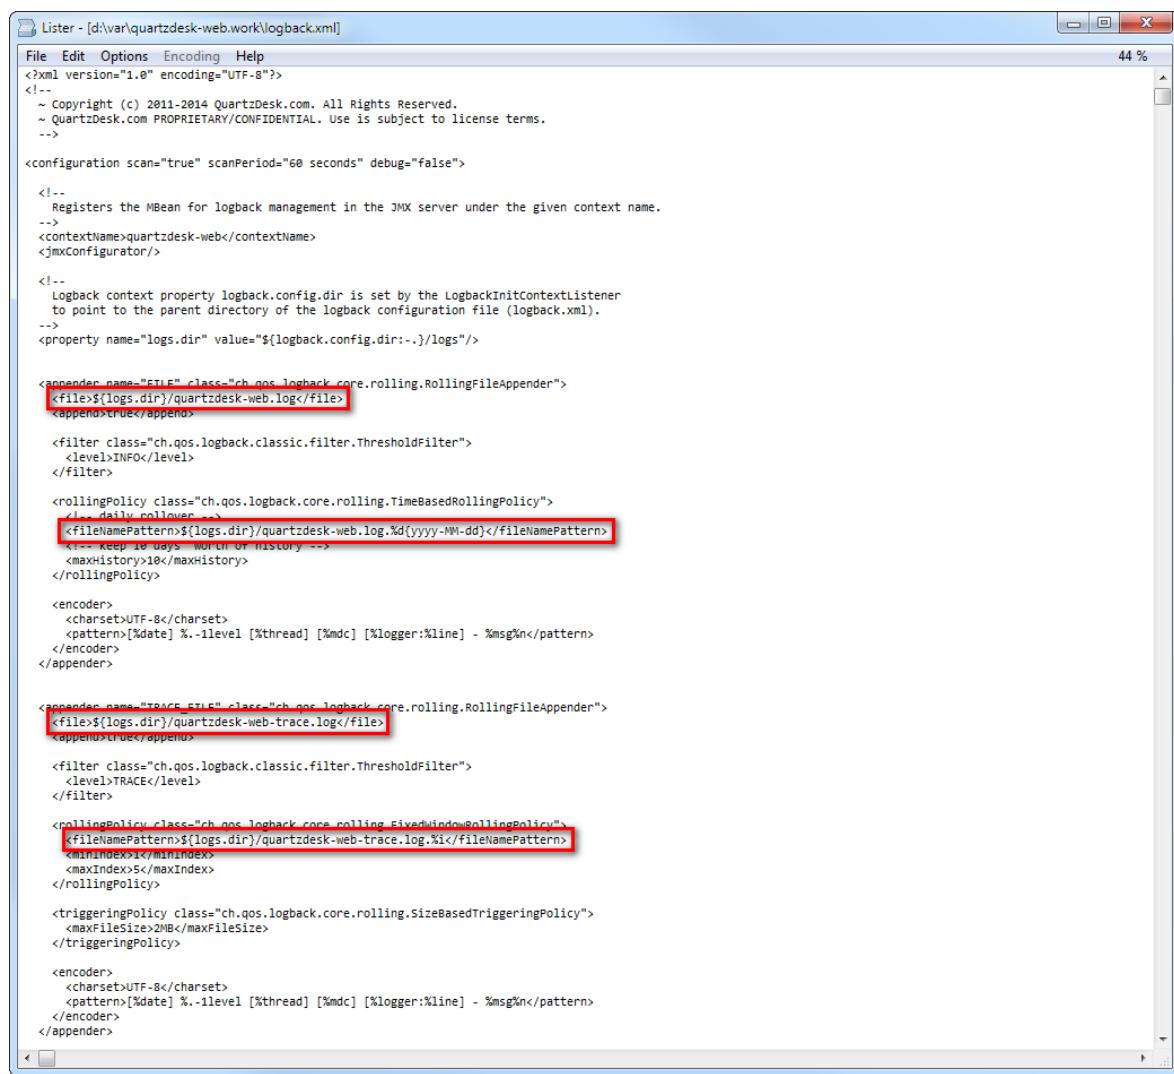

Rename the existing configuration file `quartzdesk.properties` located in the QuartzDesk Web Application work directory.

### 6.3 Rename Log Files

The names of QuartzDesk Web Application 3.x log files have changed.

| Original Log File Name (2.x)      | New Log File Name (3.x)               |
|-----------------------------------|---------------------------------------|
| <code>quartzdesk.log</code>       | <code>quartzdesk-web.log</code>       |
| <code>quartzdesk-trace.log</code> | <code>quartzdesk-web-trace.log</code> |

To use these new log file names, edit the QuartzDesk Web Application logging configuration file (`WORK_DIR/logback.xml`) and change the following lines:

```

<!-- Copyright (c) 2011-2014 QuartzDesk.com. All Rights Reserved.
~ QuartzDesk.com PROPRIETARY/CONFIDENTIAL. Use is subject to license terms.
-->

<configuration scan="true" scanPeriod="60 seconds" debug="false">

<!-- Registers the MBean for logback management in the JMX server under the given context name.
-->
<contextName>quartzdesk-web</contextName>
<jmxConfigurator/>

<!-- Logback context property logback.config.dir is set by the LogbackInitContextListener
     to point to the parent directory of the logback configuration file (logback.xml).
-->
<property name="logs.dir" value="${logback.config.dir:./logs}"/>

<appender name="FILE" class="ch.qos.logback.core.rolling.RollingFileAppender">
<file>${logs.dir}/quartzdesk-web.log</file>
<append>true</append>

<filter class="ch.qos.logback.classic.filter.ThresholdFilter">
<level>INFO</level>
</filter>

<rollingPolicy class="ch.qos.logback.core.rolling.TimeBasedRollingPolicy">
<!-- daily rollover -->
<fileNamePattern>${logs.dir}/quartzdesk-web.log.%d{yyyy-MM-dd}</fileNamePattern>
<!-- keep 10 days worth of history -->
<maxHistory>10</maxHistory>
</rollingPolicy>

<encoder>
<charset>UTF-8</charset>
<pattern>[%date] %-ilevel [%thread] [%mdc] [%logger:%line] - %msg%n</pattern>
</encoder>
</appender>

<appender name="TRACE" class="ch.qos.logback.core.rolling.RollingFileAppender">
<file>${logs.dir}/quartzdesk-web-trace.log</file>
<append>true</append>

<filter class="ch.qos.logback.classic.filter.ThresholdFilter">
<level>TRACE</level>
</filter>

<rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
<fileNamePattern>${logs.dir}/quartzdesk-web-trace.log.%i</fileNamePattern>
<minIndex>1</minIndex>
<maxIndex>5</maxIndex>
</rollingPolicy>

<triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
<maxFileSize>2MB</maxFileSize>
</triggeringPolicy>

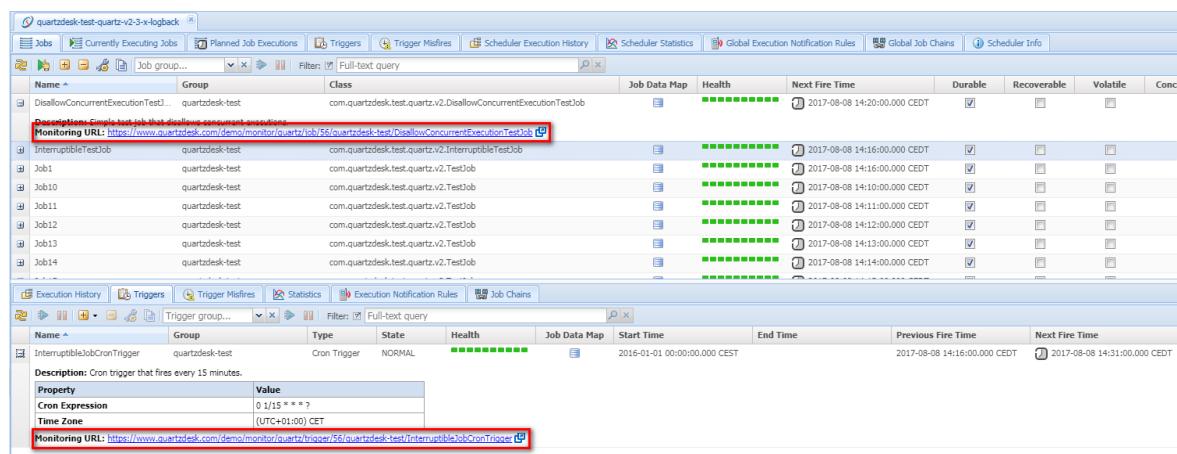

<encoder>
<charset>UTF-8</charset>
<pattern>[%date] %-ilevel [%thread] [%mdc] [%logger:%line] - %msg%n</pattern>
</encoder>
</appender>

```

Alternatively, extract the default `logback.xml` configuration file from the QuartzDesk Web Application 3.x WAR (`quartzdesk-web-x.y.z.war/extras/work/logback.xml`) and copy it to `WORK_DIR`.

## 6.4 Access to Monitoring URLs (REST API)

In QuartzDesk Web Application 2.x, the monitoring REST API URLs could be accessed by users with the QuartzDeskMonitor J2EE security role. In QuartzDesk Web Application 3.x, these monitoring URLs can be accessed by all authenticated users.

The screenshot shows two tabs of the QuartzDesk Web Application interface. The top tab displays a list of jobs under the 'Job' category, with one job highlighted. The 'Monitoring URL' for this job is shown in red. The bottom tab displays a list of triggers under the 'Triggers' category, with one trigger highlighted. The 'Monitoring URL' for this trigger is also shown in red.

We recommend that you create a dedicated user account to access these monitoring URLs. The user account can be created in Settings → Users in the QuartzDesk Web Application's GUI.

 All monitoring URLs in QuartzDesk Web Application 3.x support the HTTP Basic authentication scheme where the user's authentication credentials are passed in the Authorization HTTP header. Please note that the same authentication scheme was used by monitoring URLs in QuartzDesk Web Application 2.x.

## 6.5 Access to JAX-WS Endpoints

In QuartzDesk Web Application 2.x, all JAX-WS web service endpoints could be accessed by users with the QuartzDeskService J2EE security role. In QuartzDesk Web Application 3.x, these web service end points can only be accessed by authenticated users with particular access permissions.

The following table lists all JAX-WS web services and the security permissions that are required to access these web services.

| JAX-WS Service                                    | Required Permission       |
|---|---------------------------|
| <b>Connection Service</b>                         | WS_CONNECTION             |
| <b>Security Service</b>                           | WS_SECURITY               |
| <b>Quartz Service</b>                             | WS_QUARTZ                 |
| <b>Quartz Execution History Service</b>           | WS_QUARTZ_EXEC_HISTORY    |
| <b>Quartz Execution Notification Rule Service</b> | WS_QUARTZ_EXEC_NOTIF_RULE |
| <b>Quartz Job Chain Service</b>                   | WS_QUARTZ_JOB_CHAIN       |

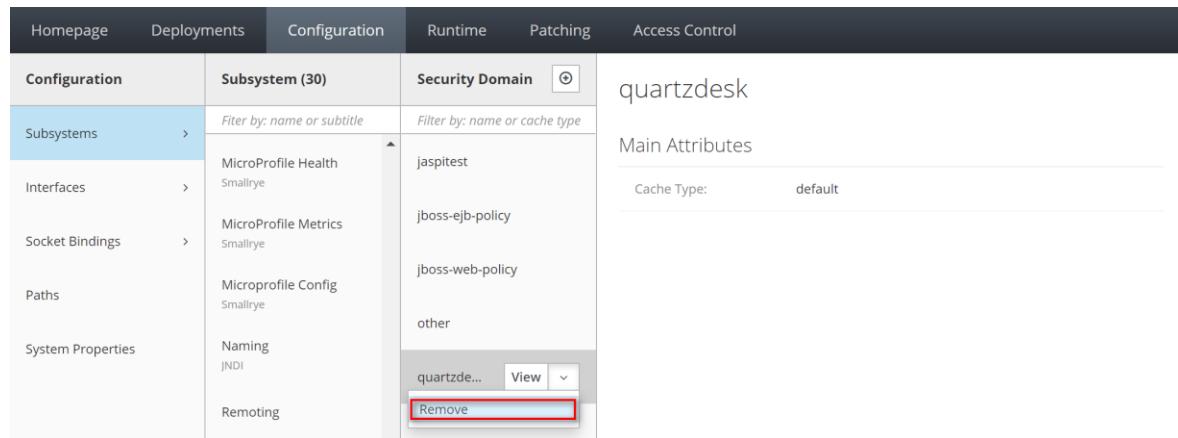

We recommend that you create a dedicated user account to access these JAX-WS endpoints. The user account can be created in Settings → Users in the QuartzDesk Web Application's GUI. Do not forget to assign the user the relevant permission(s).

 All JAX-WS web service endpoints in QuartzDesk Web Application 3.x support the HTTP Basic authentication scheme where the user's authentication credentials are passed in the Authorization HTTP header. Please note that the same authentication scheme was used by JAX-WS endpoints in QuartzDesk Web Application 2.x.

## 6.6 Remove Unused Security Domain

In WFAC go to Configuration → Subsystems → Security → Security Domain.

Select **quartzdesk** security domain and remove it by clicking on the Remove menu option in the menu next to the security domain name.

The screenshot shows the WildFly Admin Console interface. The top navigation bar includes links for Homepage, Deployments, Configuration, Runtime, Patching, and Access Control. The Configuration tab is active. Below the navigation, there's a sidebar with links for Subsystems, Interfaces, Socket Bindings, Paths, and System Properties. The main content area is titled 'Subsystem (30)' and shows a list of subsystems. A 'Security Domain' dropdown menu is open over the 'quartzdesk' entry, with options including 'View' and 'Remove'. The 'Remove' button is highlighted with a red box.

Remove the users and roles properties files that were used by the removed security domain:

`WFAS_INSTALL_ROOT/WFAS_CONFIG/quartzdesk-users.properties`

`WFAS_INSTALL_ROOT/WFAS_CONFIG/quartzdesk-roles.properties`

## 7. QuartzDesk 3.x to 4.x Migration Notes

No configuration changes are required.

## 8. Cluster Deployment Notes

When deploying QuartzDesk Web Application to a WildFly cluster you need to follow the configuration steps described in preceding chapters. In addition to these, there are several extra configuration steps that must be performed for a cluster deployment.

### 8.1 HTTP Session Replication and Affinity

QuartzDesk Web Application makes use of HTTP sessions and to store some short-lived and user-specific data. To achieve high-availability (HA), it is necessary to make the session data available on all application cluster members so that when one cluster member becomes unavailable, the remaining cluster members can take over and handle user requests without the user noticing any service interruption. To make the session data available on all application cluster members, the HTTP session replication process must be enabled on the cluster.

The amount of data stored by QuartzDesk Web Application in an HTTP session is kept at the absolute minimum to reduce the session replication overhead. The total size of data stored in the session does not exceed 1KB.

When configuring session replication, we recommend that you also enable session affinity (sticky-sessions) on the load-balancer so that all user requests are preferably passed to the WildFly instance that handled the first user request that established the session.

Please refer to the WildFly and load-balancer documentation for details on how to configure session replication and session affinity because the actual steps may vary depending on the WildFly cluster topology and configuration.

### 8.2 Shared Work Directory

We recommend that you put the QuartzDesk Web Application work directory, described in 4.4, on a shared drive and make this work directory available to all cluster members. Not only does this make application and configuration upgrading easier, it is actually required by all “Save” (for example, Save Log, Save Chart etc.) actions provided by the QuartzDesk Web Application’s GUI. These actions trigger two subsequent HTTP requests where the first request prepares the data and stores it in the `WORK_DIR/tmp` directory and the second request downloads the data and makes the browser open the Save As dialog.

During a fail-over or if the session affinity is not enabled, it can easily happen that the first request is handled by cluster member A and the second request is handled by cluster member B. If A and B are not configured to use the same `WORK_DIR/tmp` directory, then B will fail to serve the data prepared by A during the preceding request because the data will not be found.

### 8.3 Logging Configuration

If you set up your cluster to use a shared QuartzDesk Web Application work directory, as described in the previous chapter, you will need to edit the QuartzDesk Web Application logging configuration file `WORK_DIR/logback.xml` and decide where QuartzDesk Web Application instances running on individual cluster members should log. There are two options:

- 1) Logging into the same (shared) log files.
- 2) Logging into separate log files.

QuartzDesk Web Application uses two log files – `quartzdesk-web.log` and `quartzdesk-web-trace.log` that are stored in `WORK_DIR/logs` directory. The following chapters discuss these two options.

### 8.3.1 Using Shared Log Files

In order to make individual QuartzDesk Web Application instances log into the same log files, you must enable the prudent mode on both file appenders used in the `WORK_DIR/logback.xml` configuration file:

```
...
<appender name="FILE"
  class="ch.qos.logback.core.rolling.RollingFileAppender">
  <file>${logs.dir}/quartzdesk-web.log</file>
  <append>true</append>
  <prudent>true</prudent>
  ...
</appender>

<appender name="TRACE_FILE"
  class="ch.qos.logback.core.rolling.RollingFileAppender">
  <file>${logs.dir}/quartzdesk-web-trace.log</file>
  <append>true</append>
  <prudent>true</prudent>
  ...
<!--
  We must use the TimeBasedRollingPolicy because the
  FixedWindowRollingPolicy is not supported in prudent mode!
-->
<rollingPolicy class="ch.qos.logback.core.rolling.TimeBasedRollingPolicy">
  <!-- daily rollover -->
  <fileNamePattern>${logs.dir}/quartzdesk-web.log.%d{yyyy-MM-
dd}</fileNamePattern>
  <!-- keep 10 days' worth of history -->
  <maxHistory>10</maxHistory>
</rollingPolicy>

<!--
  The SizeBasedTriggeringPolicy removed because it is used only in
  conjunction with the FixedWindowRollingPolicy.
-->

<encoder>
  <charset>UTF-8</charset>
  <pattern>[%date] %-llevel [%thread] [%mdc] [%logger:%line] -
  %msg%n</pattern>
</encoder>
</appender>

...
```

For details on the Logback prudent mode, please refer to  
<http://logback.qos.ch/manual/appenders.html#FileAppender>.

Because prudent mode relies on exclusive file locks to manage concurrent access to the log files and these locks can have negative impact on the QuartzDesk Web Application's performance, we generally discourage using the prudent mode and shared log files.

### 8.3.2 Using Separate Log Files

In order to make individual QuartzDesk Web Application instances log into separate log files, you can use a JVM system property set on all cluster member JVMs. The value of this property must be unique for all cluster members. The property can be referred to from the `WORK_DIR/logback.xml` logging configuration file.

The following examples assume the use of the `cluster.member.instanceId` JVM system property, but any JVM system property name can be used.

There are two common approaches as to where the separate log files produced by individual QuartzDesk Web Application instances are stored:

- 1) Log files created under a common log root directory.

```
...
<appender name="FILE"
class="ch.qos.logback.core.rolling.RollingFileAppender">
<file>${logs.dir}/quartzdesk-web-${cluster.member.instanceId}.log</file>
<append>true</append>

...
<rollingPolicy class="ch.qos.logback.core.rolling.TimeBasedRollingPolicy">
<!-- daily rollover -->
<fileNamePattern>${logs.dir}/quartzdesk-web-
${cluster.member.instanceId}.log.%d{yyyy-MM-dd}</fileNamePattern>
<!-- keep 10 days' worth of history -->
<maxHistory>10</maxHistory>
</rollingPolicy>

...
</appender>

<appender name="TRACE_FILE"
class="ch.qos.logback.core.rolling.RollingFileAppender">
<file>${logs.dir}/quartzdesk-web-${cluster.member.instanceId}-
trace.log</file>
<append>true</append>

...
<rollingPolicy
class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
<fileNamePattern>${logs.dir}/quartzdesk-web-
${cluster.member.instanceId}-trace.log.%i</fileNamePattern>
<minIndex>1</minIndex>
<maxIndex>5</maxIndex>
</rollingPolicy>

...
</appender>
...
```

- 2) Log files created in separate (cluster member specific) log root directories.

```
...
<!--
Logback context property logback.config.dir is set by the
LogbackInitContextListener to point to the parent directory of the Logback
configuration file (logback.xml).
-->
<property name="logs.dir" value="${logback.config.dir:-.
}/${cluster.member.instanceId}/logs"/>
...
...
```

## 8.4 Internal Quartz Scheduler

QuartzDesk Web Application ships with an embedded Quartz scheduler to periodically execute its internal jobs. When deploying QuartzDesk Web Application to a cluster, it is necessary to **assign unique instance IDs to Quartz scheduler instances** running in the clustered QuartzDesk Web Application instances.

For these purposes the QuartzDesk Web Application configuration (`quartzdesk-web.properties` file) provides the `scheduler.org.quartz.scheduler.instanceIdGenerator.class` configuration property. The value of this property must be a fully-qualified class name of a Java class that implements the `org.quartz.spi.InstanceIdGenerator` Quartz API interface. Quartz API provides two out of the box implementations suitable for clustered QuartzDesk Web Application deployments:

| Implementation  | Description   |
|---|---|
| <code>org.quartz.simpl.HostnameInstanceIdGenerator</code>       | This implementation is suitable for QuartzDesk Web Application deployments where individual clustered QuartzDesk Web Application instances run on distinct hosts and each of these hosts is assigned a unique hostname.<br><br>This is the default implementation used by QuartzDesk Web Application. No configuration changes are necessary to use this instance ID generator. |
| <code>org.quartz.simpl.SystemPropertyInstanceIdGenerator</code> | This implementation is suitable for QuartzDesk Web Application deployments where some of the clustered QuartzDesk Web Application instances run on the same host.<br><br>This implementation extracts the Quartz scheduler instance ID from the <code>org.quartz.scheduler.instanceId</code> JVM system property that must be explicitly set.                                   |
|   | Please refer to the WildFly documentation for details on how to add a new JVM system property.  |

Please refer to the table above and optionally modify the value of the `scheduler.org.quartz.scheduler.instanceIdGenerator.class` configuration property according to the cluster configuration.
